Preface	13
1. Introduction	15
<i>(Jaroslav Němec)</i>	
1.1. Methods and aims of biomechanics	15
2. Some phenomenological models of the mechanical response of biomaterials	29
2.1 Introduction	29
<i>(Jaroslav Valenta)</i>	
2.2 Mathematical modelling of mechanical properties of living tissues	31
2.2.1 Evolution equations	32
2.2.2 Establishment of constitutive equations of biomaterials by the indirect method	35
2.2.3 Establishing the macroscopic state of stress of biomaterials from values of loading and displacements	39
<i>(Ladislav Trávníček)</i>	
2.2.4 A stochastic model of the response of a biomaterial with respect to internal state variables	47
<i>(Vladimír Bína, Jaroslav Valenta)</i>	
2.3 Application of the theory of catastrophes to the evolution of biosystems	58
<i>(Jaroslav Valenta)</i>	
2.4 On some aspects of the structure of bone tissue and its remodelling	63
2.4.1 Introduction	63
<i>(Jaroslav Valenta)</i>	
2.4.2 Periodic structure of long bone compacta in man	66
<i>(Radomír Čihák, Jaroslav Valenta)</i>	
2.5 Biomechanical heterogeneity	76
<i>(Vratislav Kafka)</i>	
2.5.1 Introduction	76
2.5.2 Mechanical function of the viscous material constituent	76
2.5.3 Heterogeneous tissues	78
2.5.3.1 A mathematical model of isotropic heterogeneous materials	78
2.5.3.2 A mathematical model of a transversely isotropic medium	82
2.5.4 Examples of the loading of structures of living organisms	83
2.5.4.1 Trabecular bone	83
2.5.4.1.1 A mathematical model of trabecular bone	84
2.5.4.1.2 The identification problem	87
2.5.4.1.3 A numerical example	90
2.5.4.1.4 More complex models of trabecular bone	93
2.5.4.2 The diaphysis of the femur	94
2.5.5 Conclusion	96

2.6 Piezoelectric response of bone tissue to mechanical loading	96
(Jaroslav Valenta)	
2.7 Cyclic deformation and its constitutive model	101
(Milan Šatra)	
2.7.1 Cyclic non-hardening region	105
2.7.2 A simple model	106
2.7.3 An elaborate model	107
2.8 Basic mechanical properties of tissues of the locomotion system	108
(Pavel Komárek)	
2.8.1 Bone tissue	108
2.8.2 Cartilage tissue	129
2.8.3 Muscle tissue	134
2.8.4 Tendons and ligaments	137
2.9 Mechanical properties of tissues of the cardio-vascular system	142
2.9.1 The heart	145
2.9.2 Arteries	148
2.9.3 Veins	175
2.10 Mechanical properties of some other tissues of the human body	179
2.10.1 Teeth	180
2.10.2 The oesophagus	181
2.10.3 The stomach	183
2.10.4 The intestine	184
2.10.5 Nerves	186
2.10.6 Skin	188
2.10.7 Conclusions	190
References to Chapter 2	190
3. Materials used in osteosynthesis and alloarthroplasty	204
(Stanislav Beznoska, Karel Löbl)	
3.1 Introduction	204
3.2 Metallic materials	205
3.3 A list of metallic materials used in the manufacture of implants	208
3.3.1 Stainless steel of the Cr–Mo type	210
3.3.2 Cobalt alloys of the Co–Cr–Mo type	217
3.3.3 Titanium and its alloys	221
3.3.4 Material with shape memory	226
3.4 Non-metallic materials	227
3.4.1 Oxide ceramics	227
3.4.2 Composites	230
3.5 Plastics	234
3.5.1 Polytetrafluoroethylene	236
3.5.2 Polyethyleneterephthalate (polyester)	236
3.5.3 Polyethylene	237
3.5.4 Polymethyl methacrylate	237
References to Chapter 3	240
4. Rheology of biological fluids and biomechanics of the cardio-vascular system	242
4.1 Introduction	242
(Alexandr Puzan, František Klimeš)	
4.2 Rheological properties of human blood	244
(Alexandr Puzan)	

4.2.1 Brief description of blood	244
4.2.2 Fundamental concepts and definitions	247
4.2.3 Rheological properties of blood plasma	252
4.2.4 Rheological properties of normal human blood	255
4.3 Rheometry of visco-elastic fluids	257
4.3.1 Basic types of viscosimeters	257
4.3.2 Rheogoniometry	260
4.4 Mathematical modelling of flow curves	262
4.4.1 Prandtl-Eyring and Eyring-Powell models	262
4.4.2 Power models	263
4.4.3 Herschel-Burkley model	264
4.4.4 Casson's model	265
4.5 The effect of the physical and biological properties of blood on its viscosity	267
4.5.1 The effects of temperature	267
4.5.2 The effect of osmotic pressure	268
4.5.3 The effect of the flexibility of erythrocytes	268
4.5.4 The effect of the shear rate	270
4.5.5 The effect of the haematocrit	271
4.5.6 The effect of other blood components	273
4.5.7 The effect of anti-coagulants and dextrane	275
4.6 The limits of validity of continuum models of blood	276
4.7 Rheological properties of synovial fluids	279
4.7.1 Definition and function of synovial fluids	279
4.7.2 Modelling of rheological properties of synovial fluids	279
4.7.3 The importance of the rheological properties of synovial fluids	281
4.8 Some aspects of the current state of knowledge and new trends in research into the hydrodynamics of the cardio-vascular system (<i>František Klimeš</i>)	282
4.9 The basic equations of motion of viscous fluids	289
4.10 Physical-mathematical models of the pulsating flow of blood in blood vessels	293
4.11 Fundamental theoretical analysis of oscillating and pulsatile flows of fluids in tubes	302
4.11.1 Description of the fluid	318
4.11.2 Description of the elastic wall of the tube	321
4.11.3 The interaction of the liquid with the tube wall	323
4.11.4 An approximative analytical solution	325
4.11.5 Numerical evaluation	330
4.11.6 Appraisal of the results and conclusions	333
4.12 Harmonic analysis of some hydrodynamical variables of blood circulation in the vascular system	333
4.13 Hydrodynamic aspects of the formation of arteriosclerosis	337
4.14 Experimental examination of changes with pressure in the volume and length of a segment of blood vessel	340
4.15 Simulation of some phenomena in a blood vessel by a hydraulic model	347
4.16 Experimental research and testing of artificial heart valves and complete heart replace- ments	353
4.17 Hydrodynamics of the artificial heart	366
4.18 Some basic problems of microcirculation	378
References to Chapter 4	383
5. The locomotive apparatus of man (<i>Vladimír Karas, Stanislav Otáhal</i>)	389

5.1 Composition of the locomotive apparatus	389
5.2 Elements and bonds of the locomotive apparatus	391
5.3 System of skeletal muscles	392
5.3.1 Muscle structure	393
5.3.2 Fundamental rheological properties of living non-active muscle	403
5.3.3 Muscular contraction	408
5.3.4 Thermomechanical aspects of muscle contraction	426
5.3.5 Mechanical properties of active skeletal muscle	439
5.3.6 Some problems of the study of the behaviour of human muscles under natural conditions	450
5.4 Skeleton — the basic of the segmentary structure of the body	452
5.4.1 Joint connections	457
5.4.2 Effecting active motion in joints	461
5.4.3 Some remarks on the problem of the rheology of articular connections	464
5.4.4 The problem of identifying the forces affecting skeletal elements in motion	470
5.4.5 The influence of the geometric parameters of the skeleton and of body motion on the loading of joints	471
5.4.5.1 Introductory remark	471
5.4.5.2 The contact problem	472
5.4.5.3 A note on the classical theory of contact between two inanimate bodies	472
5.4.5.4 Possibilities of theoretical prediction of the effect of the geometric properties of skeletal segments and of body motion on the loading of joints	475
5.4.5.5 Some examples of the effect of the geometric properties of the skeleton and of motion on the loading of joints	476
5.5 General problems of occupational and sports biomechanics	494
References to Chapter 5	497
6. Criminalistic biomechanics	509
(<i>Viktor Porada</i>)	
6.1 Introduction	509
6.2 Biomechanical analysis of tracks of human locomotion	511
6.2.1 Biomechanical content of tracks of bipedal locomotion	512
6.2.2 Generalized system and matrix of features of a set of tracks of human locomotion	513
6.2.2.1 Definition of a generalized system of a set of tracks of locomotion	513
6.2.2.2 Structure of the system of features of a set of tracks of locomotion	514
6.2.3 The mechanism of the origin of a track	516
6.2.4 Schematic expression of a set of traces of human locomotion	518
6.2.5 Tasks and possibilities of identification by the analysis of tracks	520
6.2.5.1 The relationship between tracks of the feet and body height	521
6.2.5.2 Basic tasks and possibilities of the analysis of tracks regarding geometry and kinematics	523
6.2.5.2.1 Assessment of the velocity of locomotion	524
6.2.5.2.2 Graphical representation of the velocity of locomotion	527
6.3 Distribution of forces in human locomotion and their measurement	534
6.3.1 Action forces for rigid surfaces	535
6.3.1.1 Methods of measuring action forces on rigid surfaces	536
6.3.1.2 Measurements of action forces for deformable surfaces in dispersive environments	539
6.4 Some theoretical aspects of the identification of a criminal by his tracks in a dispersive environment	542
6.4.1 Simulation of a track by means of equivalent loading	543
6.4.2 Evaluation of the overall compression by means of the compression coefficient	545

6.4.3 The balance of forces and energy during locomotion	547
6.5 Methods of measuring the geometric features with biomechanical content for the analysis of tracks of bare feet	555
6.6 Bioballistics (<i>Přemysl Liška</i>)	562
6.6.1 Introduction	562
6.6.2 The mechanism of injury	562
6.6.3 Equation of motion of a projectile penetrating a target	568
6.6.4 Deformation and projectile stability	578
6.6.5 Interaction of a projectile with the body of a human or animal	585
References to Chapter 6	587
Subject Index	591
