|--------------------------------------|------|
| PREFACE | iii |
| NOTATION AND ABBREVIATIONS | xi |

CHAPTER I

| | |
|----------------------------------|---|
| MATHEMATICAL PROCESSES | 1 |
|----------------------------------|---|

Introduction—Some algebraic equations—Progressions and binomial series—Algebraic notation—Exponential and logarithmic functions—Trigonometric functions—Real hyperbolic functions—Complex numbers—Polar form of complex numbers—The Argand diagram—Hyperbolic and trigonometric functions—Linear differential equations

CHAPTER II

| | |
|--|----|
| FUNDAMENTALS OF ALTERNATING CURRENT THEORY | 25 |
|--|----|

Introduction—Electrostatics—Self, direct, and mutual capacitance—Electrostatic unit of capacitance—Continuous currents—Magnetism—Vector potential—Electromagnetism—Vector potential due to steady currents—Electromagnetic induction—Units—Self and mutual inductance—Induced E.M.F. and vector potential—Incomplete circuit—Inductance of parts of a circuit—Mechanical analogies—Algebraic and vectorial methods in alternating currents—The vectorial method—The algebraic method—Extended algebraic method—The basis of electromagnetism

CHAPTER III

| | |
|---------------------------------------|----|
| THEORY OF ELECTRIC CIRCUITS | 66 |
|---------------------------------------|----|

Introduction—Impedance and admittance—Kirchhoff's laws and Maxwell's circulating currents—Coupled circuits—Series and parallel impedances and admittances—The general ladder network—Application to coupled circuits—Reciprocal theorem—Compensation theorem—Thévenin's theorem—Star-mesh transformation—Theorem on the general three-terminal network—Mechanical and acoustic analogies—Acoustic gramophone—Another system of acoustic analogy—Acoustic ladder networks—Electro-acoustics—Electromagnetic case—Electrostatic case—Piezo-electricity—Negative resistance—The continuous line

CHAPTER IV

| | |
|--|----|
| DESIGN OF RESISTANCES, COILS, AND CONDENSERS | 99 |
|--|----|

Introduction—Design of resistance—Skin and proximity effects—Measurement of resistance—Design of inductances—Permeability—Chokes with air-gap—Permalloy and mumetal—Dust cores—Dust core losses—Ferrocarril—Air-cored coils—Self capacitance of coils—High frequency resistance of coils—Screened coils—Transformers—Practical transformers—Equivalent network of a transformer—Input and intervalve transformers—Transformers between low impedances—Condensers—Electrolytic condensers—Quartz crystal

CHAPTER V

| | PAGE |
|-----------------------------------|------|
| TWO-TERMINAL IMPEDANCES | 146 |

Introduction—Impedance with given frequency-characteristic—The frequency-characteristic of a given impedance—Series combination (L, R, C)—Parallel combination of inductance and capacitance—Selectivity and wave-trap—Impedance presented by a transformer—Equivalent networks—Inverse networks—A general reactance theorem—A general theorem on impedance

CHAPTER VI

| | |
|----------------------------------|-----|
| FOUR-TERMINAL NETWORKS | 168 |
|----------------------------------|-----|

Introduction—Linear parameters of the four-terminal network—Image parameters (and open- and short-circuit impedances)—Iterative parameters—Terminations and loss factors—Units of transmission losses—The neper—The decibel or db—Mile of standard cable—Insertion losses—Combinations of four-terminal networks—Tandem combination—Parallel combination—The Π -section—Attenuating pads, type T—The Π -section—Attenuating pads, type Π —The lattice section—Bridged-T section—Constant-resistance, recurrent networks

CHAPTER VII

| | |
|------------------------|-----|
| WAVE FILTERS | 201 |
|------------------------|-----|

Introduction—Conditions for pass and attenuation bands—Conditions for the ladder-type, filter section—Conditions for the lattice-type section—Design of lattice-type filter sections—Ladder- and Π -type, filter sections—Constant- k filter—Constant- k , low-and-band-pass filter—General ladder-type filter with $K_1 = K_{1k}$ or $K_2 = K_{2k}$ —General mid-series equivalent wave filter—General mid-shunt equivalent wave filter—M-type filters—MM'-type filters—Mid-series equivalent, low-and-band-pass filter—Mid-shunt equivalent, low-and-band-pass filter—Composite wave filters—Propagation constant of lattice section—Propagation constant of ladder section

CHAPTER VIII

| | |
|---------------------------|-----|
| LOW PASS FILTER | 240 |
|---------------------------|-----|

Introduction—Constant- k , low pass filter—M-type, low pass filter—MM'-type, low pass filter—Lattice-type, low pass filter—Effect of dissipation in low pass filter—Effects of terminations—An example of low pass filter design—Smoothing circuits and scratch filter—Summary

CHAPTER IX

| | |
|----------------------------|-----|
| HIGH PASS FILTER | 264 |
|----------------------------|-----|

Introduction—Constant- k , high pass filter—M-type, high pass filter—MM'-type, high pass filter—Effect of dissipation in a high pass filter—Effects of terminations—Design of high pass filter—Complementary filters—Complementary filters in parallel and in series—Application of constant-resistance networks to filters in parallel—Summary

CHAPTER X

| | PAGE |
|--|------------|
| BAND PASS FILTER | 275 |
| Introduction—Constant- k , band pass filter, type I—Mid-series equivalent, band pass filter, type II—Mid-shunt equivalent, band pass filter—M-type, band pass filter—Three-element band pass filter—Type III—Type IV—Four-element, band pass filter—Type V; with distinct $\omega_{1\infty}$ —Type VI; with distinct $\omega_{2\infty}$ —Five-element, band pass filter—Type VII—Type VIII—Other types of section—Design data for band pass filter—Equivalent combinations—Effects of dissipation—Impedance transforming band pass filters—Design of a band pass filter for carrier telegraphy—Use of mutual inductance in band pass filters—Transformers as band pass filters—High frequency tuned circuits—Superheterodyne band pass filter—Band elimination filters—Piezo-crystal band elimination filter—Magnetostriction band pass filter | |

CHAPTER XI

| | |
|--|------------|
| CALCULATION AND MEASUREMENT OF PERFORMANCE | 314 |
| Introduction—Reflection losses—Reflection losses with mid- m -type termination—Reflection losses with x -termination of constant- k type—Calculation and measurement of attenuation of the filters of pages 296–300—Measurement of attenuation and phase-shift—Filter test set—Impedance method of measuring propagation constant—Loop attenuation method—Method of measuring time-delay | |

CHAPTER XII

| | |
|--|------------|
| TRANSIENTS IN NETWORKS | 332 |
| Introduction—Periodic waves—Transient waves—Steady state treatment of transient waves—The general problem of transmission—Conditions for distortionless transmission—Attenuation distortion—D.C. applied to ideal low pass filter—Attenuation distortion in band pass filter—Phase distortion—When $dB/d\omega$ is made constant—Distortion due to linear-phase intercept—Measurement of linear-phase intercept—Transients in actual filters | |

APPENDICES

| | |
|---|-----|
| I. LOW PASS FILTER—SUMMARY | 355 |
| II. HIGH PASS FILTER—SUMMARY | 356 |
| III. BAND PASS FILTER—SUMMARY | 357 |
| IV. NOMOGRAM FOR THE BAND PASS FILTER | 359 |
| V. DEVELOPMENT OF THE LATTICE-TYPE FILTER | 364 |

CONTENTS

| | PAGE |
|---|------|
| VI. CONSTANT-RESISTANCE NETWORKS WITH APPLICATIONS TO FILTER GROUPS | 422 |
| VII. CONSTANT-RESISTANCE FILTER | 432 |
| VIII. IMPEDANCE CORRECTION | 439 |
| IX. FILTERS USING QUARTZ CRYSTALS | 451 |
| INDEX | 467 |

INSETS

| | |
|--|-----|
| Phase-shift as a Function of $K \phi = Z_1/4Z_2$ | 234 |
| Attenuation and Phase-shift in and about the Transmitting Band: $\alpha = \pm 2/\pi$ has the sign of V | 236 |
| Attenuation and Phase-shift in and about the Transmitting Band: $\alpha = \pm 2/\pi$ has the sign of V | 236 |
| Nomogram for the Band Pass Filter, Type 4L | 361 |
| Line Chart for Tschebyscheff Parameters | 394 |
