<b>1</b>	<b>The physics of fluids</b>	<b>1</b>
1.1	The liquid state	1
1.1.1	The different states of matter: model systems and real media	2
1.1.1.1	The visual representation of different states of matter by means of an air table	2
1.1.1.2	Numerical simulations in terms of a hard-disc model	4
1.1.1.3	Three-dimensional models	5
1.1.2	The solid–liquid transition: a sometimes nebulous process	7
1.1.2.1	Modelling plastic flow in two dimensions	7
1.1.2.2	The effect of the rate of change of the stresses on the deformation of a medium	8
1.2	Macroscopic transport coefficients	8
1.2.1	Thermal conductivity	9
1.2.1.1	A definition of thermal conductivity: the equation for heat under stationary conditions	9
1.2.1.2	Application of the thermal conductivity equation to a cylindrical geometry	11
1.2.1.3	Thermal exchanges under non-stationary conditions: the Fourier equation	12
1.2.1.4	Application to the one-dimensional propagation of temperature variations	14
1.2.1.5	Transient heat diffusion in a cylindrical geometry	17
1.2.1.6	Propagation: diffusion versus wave motion	18
1.2.2	Mass diffusion	18
1.2.2.1	Conservation of mass for a diffusing substance	18
1.2.2.2	The spreading of a tracer initially localized in a plane	19
1.3	Microscopic models for transport coefficients	21
1.3.1	A different approach to mass diffusion: the random walk	21
1.3.2	Transport coefficients for an ideal gas	24
1.3.2.1	The representative elementary volume	24
1.3.2.2	The calculation of the molecular diffusion coefficient for an ideal gas	24
1.3.2.3	The calculation of thermal diffusivity for an ideal gas	27
1.3.2.4	The applicability of the ideal gas model	28
1.3.3	Diffusive transport phenomena in liquids	28
1.3.3.1	The molecular diffusion coefficient for liquids	29

1.3.3.2	The thermal conductivity of liquids	30
1.3.3.3	A comparison of the numerical values of diffusive transport coefficients in different liquids and gases	31
1.4	Surface and surface tension effects	31
1.4.1	Surface tension	31
1.4.2	The pressure difference between the two sides of a curved interface: Laplace's law	32
1.4.3	Variations in the surface tension due to a surfactant	35
1.4.4	The Rayleigh–Taylor instability	37
1.5	The spectroscopy of liquids	40
1.5.1	Some common techniques for probing the microscopic structure of liquids	40
1.5.1.1	Macroscopic properties and microscopic probes	40
1.5.1.2	Characteristic orders of magnitude for standard probe techniques	41
1.5.2	The form factor and elastic X-ray diffraction: an example of the use of scattering on an atomic scale	42
1.5.2.1	The radial distribution function for a liquid	42
1.5.2.2	The relation between the radial distribution function and angular variations observed in the scattering amplitude	43
1.5.2.3	Inelastic scattering	45
1.5.3	Elastic and quasi-elastic scattering of light: a tool for the study of the structure and diffusive transport in liquids	46
1.5.3.1	A simple example of the elastic scattering of light: Rayleigh scattering by a dilute emulsion	46
1.5.3.2	Forced Rayleigh scattering: an example of diffraction due to fluctuations in temperature or concentration	47
1.5.3.3	Spontaneous Rayleigh scattering of visible light	51
1.5.4	Inelastic scattering of light in liquids	52
1.5.4.1	An illustration of inelastic Doppler scattering: forced Brillouin scattering	52
1.5.4.2	Spontaneous Brillouin scattering	54
	Appendix: typical orders of magnitude for a number of physical parameters characteristic of the interfacial properties of ordinary liquids	55
<b>2</b>	<b>The diffusion of momentum under various flow conditions</b>	<b>57</b>
2.1.	Diffusive and convective momentum transport in flowing fluids	57
2.1.1	Diffusion and convection of momentum: two illustrative experiments	57
2.1.2	Momentum transport in shear flow: an introduction to the concept of viscosity	59
2.1.2.1	A macroscopic definition of viscosity	59
2.1.2.2	The diffusion equation for momentum	61
2.1.2.3	Application to a specific example: flow near a solid wall suddenly set in motion parallel to its own plane	62

2.2.	Microscopic models of viscosity	64
2.2.1	The viscosity of gases	64
2.2.2	The viscosity of liquids	67
2.2.3	Numerical simulation of the particle trajectories in a flowing fluid	69
2.3	A comparison of diffusion and convection mechanisms	71
2.3.1	The Reynolds number	71
2.3.2	Convective and diffusive mass and heat transport	73
2.3.2.1	Mass transport	73
2.3.2.2	Heat transport	74
2.4	The description of different flow regimes	76
2.4.1	Different flow regimes in the wake of a cylinder	77
2.4.2	Transitions in the shedding of vortices behind a cylinder: the Landau model	79
2.4.2.1	A simple experimental model of a mechanical instability	79
2.4.2.2	Flow in the neighbourhood of the vortex-generation threshold	82
2.4.2.3	A description of the Landau model	83
2.4.2.4	Oscillation regimes at large Reynolds numbers: the transition towards turbulence—large-scale structures in turbulent flows	87
<b>3</b>	<b>The kinematics of fluids</b>	<b>89</b>
3.1	The description of motion of a fluid	89
3.1.1	Characteristic linear scales and the hypothesis of continuity	89
3.1.2	The Eulerian and Lagrangian descriptions of fluid motion	90
3.1.3	Acceleration of a particle of fluid	91
3.1.4	Streamlines and stream-tubes, pathlines, and streaklines	93
3.1.5	Visualization of flows	95
3.1.5.1	Tracking by means of bubbles, smoke (gases), or dyes (liquids)	95
3.1.5.2	Visualization by the use of anisotropic, reflecting particles	97
3.1.5.3	Visualization by means of photo-active substances	97
3.1.5.4	Visualization of variations in the index of refraction by the Schlieren method	98
3.2	Deformations in flows	99
3.2.1	The local components of the velocity gradient field	100
3.2.2	Analysis of the symmetric component: pure strain (deformation)	100
3.2.2.1	Deformations due to the diagonal terms of the velocity-gradient tensor	101
3.2.2.2	Deformations due to the off-diagonal terms of the velocity-gradient tensor	103
3.2.3	Analysis of the antisymmetric component: pure rotation	104
3.2.4	Small and large deformations	106
3.2.4.1	The case of small deformations	107
3.2.4.2	Large deformations	109
3.3	The conservation of mass in fluid flow	110
3.3.1	The equation of continuity	110
3.3.2	The incompressibility of a fluid	112
3.3.3	Analogies with electromagnetic theory	114

3.4	The stream function	115
3.4.1	The introduction and significance of the stream function	115
3.4.2	Examples of two-dimensional flows and of their stream functions	117
3.4.3	Axially symmetric flows	121
3.5	Some measurements of velocity and of velocity gradients in fluid flows	122
3.5.1	Measurement of the local velocity of a fluid: laser Doppler anemometry	122
3.5.1.1	The relationship between the fluid velocity and the frequency of the optical signal	123
3.5.1.2	Advantages of laser Doppler anemometers	125
3.5.1.3	Problems and limitations	125
3.5.2	Determination of the local velocity gradients	125
3.5.2.1	The use of thermal marking	126
3.5.2.2	The use of partially reflecting particles	127
<b>4</b>	<b>The dynamics of fluids: local equations</b>	<b>128</b>
4.1	Surface forces	128
4.1.1	The general expression for the surface forces	128
4.1.1.1	The stress tensor	128
4.1.1.2	Pressure forces and the shear stress tensor	132
4.1.2	The characteristics of the viscous shear stress tensor	132
4.1.3	The viscous shear stress for a Newtonian fluid	134
4.1.4	Non-Newtonian fluids	136
4.1.4.1	Behaviour dependent on the applied stress	136
4.1.4.2	Non-Newtonian time-dependent fluids	138
4.1.4.3	Some types of complex non-Newtonian behaviour	139
4.2	The equation of motion for a fluid	140
4.2.1	The general equation for the dynamics of a fluid	140
4.2.2	The Navier–Stokes equation of motion for a Newtonian fluid	142
4.2.3	Euler’s equation of motion for an ideal fluid	143
4.2.4	The dimensionless form of the Navier–Stokes equation	143
4.3	Boundary conditions for fluid flow	144
4.3.1	The boundary condition at a solid wall	144
4.3.2	Boundary conditions at the interface between two fluids: surface tension effects	145
4.4	A few specific solutions of the Navier–Stokes equations	147
4.4.1	The Navier–Stokes equation for one-dimensional flow	147
4.4.2	Simple shear flow (plane Couette flow)	148
4.4.3	Poiseuille flow (a viscous fluid flowing in a stationary conduit)	149
4.4.3.1	Flow between parallel planes	150
4.4.3.2	Flow in a cylindrical tube	152
4.4.4	Oscillating flows in a viscous fluid	155
4.4.4.1	Shear flow near a plane oscillating parallel to itself	155
4.4.4.2	The flow between two parallel planes induced by an oscillating pressure gradient	158
4.4.5	Flow driven by a gradient in the surface tension (the Marangoni effect)	160
4.4.6	Cylindrical Couette flow	163

Appendix: representation of the stress tensor, the equation of continuity, and the Navier–Stokes equations, for Newtonian fluids, in the most commonly used co-ordinate systems	167
A.1 Cartesian co-ordinates ( $x, y, z$ )	167
A.2 Cylindrical co-ordinates ( $\rho, \varphi, z$ )	167
A.3 Spherical polar co-ordinates ( $r, \theta, \varphi$ )	168
<b>5 The conservation laws</b>	<b>170</b>
5.1 Conservation of mass	170
5.2 Conservation of momentum	171
5.2.1 The local equation	171
5.2.2 The integral expression of the law of conservation of momentum	172
5.2.2.1 The integral of the equation for conservation of momentum	172
5.2.2.2 The case of an incompressible Newtonian fluid	173
5.2.2.3 The application of the momentum conservation laws to simple flows	174
5.3 The conservation of kinetic energy: Bernoulli's equation	176
5.3.1 The conservation of energy for a flowing incompressible fluid with or without viscosity	177
5.3.1.1 Derivation of the conservation equation	177
5.3.1.2 Kinetic energy dissipation through viscosity in a simple shear flow	178
5.3.1.3 Kinetic energy dissipation in a Newtonian fluid	179
5.3.2 Bernoulli's equation: applications	180
5.3.2.1 Bernoulli's equation for stationary flow	180
5.3.2.2 Bernoulli's equation for potential flow	181
5.3.2.3 Applications of Bernoulli's equation	182
5.3.2.4 The form of Bernoulli's equation for flow along a curve	187
5.4 Applications of the laws of conservation of energy and momentum	189
5.4.1 A jet incident on to a plane	189
5.4.2 The exit jet from an opening in a reservoir	192
5.4.2.1 The determination of the velocity in the exit jet	192
5.4.2.2 Calculation of the <i>vena contracta</i>	193
5.4.2.3 The force exerted by the fluid on the container	194
5.4.3 The force on the walls of an axially symmetric conduit with variable cross-section	194
5.4.4 The hydraulic jump	197
5.4.4.1 The qualitative properties of hydraulic jumps	197
5.4.4.2 Liquid flow over a weir	199
5.4.4.3 The hydraulic jump	203
5.4.4.4 The relation between the fluid levels and the velocities on the two sides of the jump	205
5.4.5 Another application: a discharge sluice gate in a channel	205
5.4.5.1 The reaction force on the sluice gate	206
5.4.5.2 The critical Froude number resulting from the application of Bernoulli's equation	207

<b>6</b>	<b>Potential flow</b>	<b>208</b>
6.1	Introduction	208
6.2	Definitions, properties, and examples of potential flow	210
6.2.1	Characteristics and examples of the velocity potential	210
6.2.2	The uniqueness of the velocity potential	210
6.2.3	Velocity potentials for simple flows and combinations of potential functions	214
6.2.3.1	Uniform parallel flow	215
6.2.3.2	Vortex flow	216
6.2.3.3	Sources and sinks	217
6.2.3.4	Dipole flow	219
6.2.3.5	Solutions of Laplace's equation: superposition and separation of variables	220
6.2.4	Examples of simple potential flows	221
6.2.4.1	Flow around a circular cylinder	221
6.2.4.2	A sphere in uniform flow	226
6.2.4.3	The Rankine solid	227
6.2.4.4	The sink and vortex	229
6.3	Forces acting on an obstacle in potential flow	230
6.3.1	Two-dimensional flow	230
6.3.1.1	The velocity potential	230
6.3.1.2	The forces acting on a two-dimensional obstacle	231
6.3.2	The case of an obstacle in three dimensions	236
6.3.2.1	The derivation of the velocity potential and of the pressure field around a finite three-dimensional obstacle	236
6.3.2.2	The kinetic energy of the fluid	237
6.3.2.3	Impulse	239
6.3.2.4	The force on a solid object	240
6.3.2.5	The particular case of a spherical object	240
6.4	Linear surface waves on an ideal fluid	240
6.4.1	Swells, cat's paws, and breaking waves	241
6.4.2	Trajectories of fluid particles during the passing of a wave	245
6.4.3	Solitons	246
6.5	An electrical analogue for two-dimensional potential flows	248
6.5.1	Direct analogue	249
6.5.2	Inverse analogue	249
6.6	The complex velocity potential	252
6.6.1	The definition of a complex potential	252
6.6.2	Complex potentials for several types of flow	253
6.6.2.1	Uniform parallel flow	253
6.6.2.2	Source and vortex	253
6.6.2.3	Dipole flow	254
6.6.2.4	Flow around a corner or near a stagnation point	254
6.6.3	Conformal mapping	256
6.6.3.1	The conformal mapping method	256
6.6.3.2	Transformation of a plane into a corner	259
6.6.3.3	The Joukowski transformation: modelling an airplane wing in potential flow	259

Appendix A1: velocity potentials and stream functions for two-dimensional flows	266
Appendix A2	267
A2.1 Derivation of the velocity components from the stream function	267
A2.2 Derivation of the velocity components from the velocity potential	267
<b>7 Vorticity: dynamics of vortices</b>	<b>268</b>
7.1 Vorticity and its electromagnetic analogue	268
7.1.1 The vorticity vector	268
7.1.2 The electromagnetic analogue	269
7.1.3 Straight vortex tubes: the analogy with the magnetic field due to a current-carrying wire	271
7.1.3.1 The magnetic field around a straight wire and velocity field resulting from a straight vortex tube	271
7.1.3.2 An example of a line vortex: the Rankine vortex	274
7.1.3.3 The kinetic energy per unit length of a line vortex	276
7.1.4 The application of the electromagnetic analogy in dealing with arbitrary distributions of vorticity	277
7.1.4.1 The hydrodynamic equivalent of the law of Biot and Savart	277
7.1.4.2 An example: a self-induced velocity field due to a curved vortex line	278
7.2 The dynamics of circulation	279
7.2.1 Kelvin's theorem: the conservation of circulation	280
7.2.1.1 Derivation of Kelvin's theorem	280
7.2.1.2 The physical significance and consequences of Kelvin's theorem	281
7.2.2 Sources of circulation in the flow of viscous or compressible fluids, or in the presence of non-conservative forces	284
7.2.2.1 Non-conservative volume forces (term I of (7.30))	284
7.2.2.2 Non-barotropic fluids (term II of (7.30))	286
7.2.2.3 Viscosity effects (term III of (7.30))	288
7.3 The dynamics of vorticity	289
7.3.1 The transport equation for vorticity, and its consequences	289
7.3.1.1 The Helmholtz equation for an incompressible fluid	289
7.3.1.2 Elongation and twisting of vortex tubes	291
7.3.1.3 An example of the application of the conservation of vorticity: Hill's spherical vortex	293
7.3.2 Equilibrium between elongation and diffusion in the dynamics of vorticity	295
7.3.2.1 The evolution of vorticity in an axially symmetric, elongational flow	295
7.3.2.2 The creation and annihilation of vorticity in turbulent flow	297
7.3.2.3 A qualitative model for turbulence	298
7.4 A few examples of distributions of vorticity concentrated along singularities: systems of vortex lines	298
7.4.1 A few cases with vorticity concentrated in vortex filaments	298

7.4.2	The dynamics of a system of parallel line vortices	300
7.4.2.1	Parallel, line-vortex pairs	300
7.4.2.2	Continuous and discrete vortex sheets	301
7.4.2.3	Vortex streets	301
7.4.3	Vortex rings	305
7.4.3.1	The velocity of a vortex ring	306
7.4.3.2	The kinetic energy of a vortex ring	307
7.4.3.3	The momentum of a vortex ring	307
7.4.3.4	Interactions between vortex rings, or between a ring and a solid wall	310
<b>8</b>	<b>Flow at low Reynolds numbers</b>	<b>311</b>
8.1	Examples of low-Reynolds-number flows	311
8.2	The equation of motion at low Reynolds number	313
8.2.1	The Stokes equation	313
8.2.2	Further equivalent representations of the Stokes equation	314
8.2.3	Properties of solutions of the Stokes equation	315
8.2.3.1	Uniqueness	315
8.2.3.2	Reversibility	316
8.2.3.3	Superposition in the solutions of the Stokes equation	321
8.2.3.4	A minimum in the energy dissipation	322
8.2.4	Dimensional-analysis predictions for flows at low Reynolds number	323
8.3	The forces and torques acting on a moving solid body	324
8.3.1	Linear proportionality between the velocity of the solid body and the external forces	325
8.3.2	General symmetry properties of the tensors $A_{ij}$ , $B_{ij}$ , $C_{ij}$ , and $D_{ij}$	326
8.3.3	The effect of the symmetry of solid bodies on the applied forces and torques	327
8.3.3.1	Relationships between tensor coefficients for a solid body having a plane of symmetry	328
8.3.3.2	Bodies with three mutually perpendicular planes of symmetry	329
8.3.3.3	Translational–rotational coupling for a body devoid of planes of symmetry	331
8.4	Uniform-velocity motion of a sphere in a viscous fluid	333
8.4.1	The velocity field around a moving sphere	333
8.4.1.1	The calculation of the pressure field	335
8.4.1.2	The vorticity field corresponding to the distribution of pressure	335
8.4.1.3	The evaluation of the stream function $\Psi$ from the vorticity	336
8.4.1.4	The calculation of the velocity field	337
8.4.2	The force acting on a moving sphere in a fluid of infinite extent: the drag coefficient	338
8.4.3	The generalization of the solution of the Stokes equation to other experiments	340
8.4.3.1	A drop of fluid in motion within another immiscible fluid	340
8.4.3.2	The frictional force on an object of arbitrary shape	341

8.4.4	Limitations on the Stokes treatment of flow at low Reynolds numbers: the Oseen equation	343
8.4.4.1	The kinetic energy of the fluid flowing far from the sphere	344
8.4.4.2	Convection and acceleration effects far from the sphere: the Oseen equation	344
8.4.4.3	Forces on an infinite circular cylinder in low-Reynolds-number flow	346
8.5	Quasi-parallel flows at low Reynolds numbers: lubrication	347
8.6	Dynamics of suspensions	351
8.6.1	The rheology of suspensions	352
8.6.2	Sedimentation of particles in a suspension	357
8.6.2.1	The sedimentation of dilute suspensions	357
8.6.2.2	The sedimentation of concentrated suspensions	359
8.7	Flow in porous media	361
8.7.1	A few characteristic examples of the different types of flows	361
8.7.2	Parameters characterising a porous medium	362
8.7.2.1	Porosity	362
8.7.2.2	Pore size	362
8.7.2.3	Pore geometry	362
8.7.2.4	Length scales characteristic of porous media	364
8.7.3	Flow in porous media: Darcy's law	366
8.7.3.1	One-dimensional low-velocity flow	366
8.7.3.2	The Darcy equation generalized to three dimensions	367
8.7.3.3	The pressure–flow rate relation at high velocities in a porous medium	368
8.7.3.4	A two-dimensional model of a porous medium: the Hele–Shaw cell	368
8.7.4	Permeability models for media with cylindrical pores	370
8.7.4.1	An estimate of the permeability for a porous medium modelled by a group of parallel capillaries	370
8.7.4.2	The permeability of a system of winding capillaries	371
8.7.4.3	The Carman–Kozeny relation	372
8.7.5	The permeability of porous media containing channels of variable cross-section	373
8.7.5.1	A simplified model of a periodic porous medium	373
8.7.5.2	The relationship between the size of the grains, the permeability, and the electric conductivity for a medium made from sintered glass beads	374
8.7.5.3	The relationship between the sizes of channels, the conductivity, and the permeability for natural porous samples	375
8.7.6	The flow of immiscible fluids in a porous medium	377
8.7.6.1	The effects of capillary forces on two-phase flows in porous media	377
8.7.6.2	Drainage flows at very low velocity	378
8.7.6.3	The concept of relative permeability of a porous medium	380

<b>9</b>	<b>Laminar boundary layers</b>	<b>383</b>
9.1	Introduction	383
9.2	A qualitative physical discussion of the structure of the boundary layer near a flat plate in uniform flow	385
9.3	The equations of motion within the boundary layer: Prandtl theory	388
9.3.1	The equations of motion near a flat plate	388
9.3.2	Transport of vorticity in the boundary layer	390
9.3.3	Self-similarity of the velocity profiles in the boundary layer for the case of uniform, constant, external velocity	390
9.4	Velocity profiles within boundary layers	393
9.4.1	The Blasius equation for uniform external flow along a flat plate	393
9.4.2	An approximate solution of the Blasius equation	394
9.4.3	The frictional force on a flat plate in a uniform flow	397
9.4.4	The thickness of boundary layers	397
9.4.4.1	The displacement thickness $\delta^*$	398
9.4.4.2	The momentum thickness $\delta^{**}$	399
9.4.5	The hydrodynamic stability of a laminar boundary layer: turbulent boundary layers	399
9.5	The laminar boundary layer in the presence of an external pressure gradient: boundary layer separation	400
9.5.1	A simplified physical treatment of the problem	400
9.5.2	Self-similar velocity profiles: flows such that $U(x) = Cx^m$	401
9.5.2.1	The Falkner–Skan equation	401
9.5.2.2	Velocity profiles within the boundary layer	402
9.5.2.3	An approximate calculation of the condition for boundary layer separation	404
9.5.3	Boundary layers with constant thickness	406
9.5.4	Flows lacking self-similarity: boundary layer separation	407
9.5.5	The practical consequences of boundary layer separation	409
9.5.6	Separation of turbulent boundary layers: the decrease of the drag force	409
9.6	A few applications of boundary layer separation problems in aerodynamics	412
9.6.1	The aerodynamics of airplane wings	412
9.6.1.1	The mechanism that supports an airplane	412
9.6.1.2	The separation phenomenon	415
9.6.1.3	Control of the boundary layer by means of leading-edge wing flaps	416
9.6.1.4	Control of the boundary layer by means of trailing-edge wing flaps	417
9.6.2	Controlling boundary layer separation by suction	417
9.6.3	The control of boundary layer separation by adjustment of the profile of the solid object	417
9.6.3.1	The ‘Fastback’ profile for an automobile	417
9.6.3.2	An aerodynamic baffle over the gap between the cab and trailer, in a tractor–trailer combination	420
9.7	Thermal and mass boundary layers	420

9.7.1	Thermal boundary layers	421
9.7.1.1	The case of a Prandtl number much greater than unity	422
9.7.1.2	The case of a Prandtl number much smaller than unity	425
9.7.1.3	The case of a Prandtl number of order unity	425
9.7.1.4	An application of the heat exchange laws between a solid and a flowing fluid: the hot-wire anemometer	425
9.7.2	Concentration boundary layers and polarography	428
9.7.2.1	The concentration boundary layer resulting from an electrode embedded in a wall	428
9.7.2.2	Measurement of a velocity near a wall by a polarographic method	430
9.8	The laminar wake	432
9.8.1	A qualitative approach to the problem	432
9.8.2	The solution of the equation of motion in the wake far from the object	433
9.8.2.1	The wake behind an object that is finite in all directions	433
9.8.2.2	The wake behind an infinitely long cylinder	435
9.8.3	The drag force on a body: the relationship with the velocity profile in the wake	435
<b>10</b>	<b>Hydrodynamic instabilities</b>	<b>439</b>
10.1	Thermal convection	439
10.1.1	Convective transport equations for heat	439
10.1.2	Thermal convection resulting from a horizontal temperature gradient	440
10.2	The Rayleigh–Bénard instability	443
10.2.1	A description of the Rayleigh–Bénard instability	444
10.2.2	The mechanism of the Rayleigh–Bénard instability, and orders of magnitude	445
10.2.2.1	A qualitative mechanism for the instability	445
10.2.2.2	The physical criterion for the instability ( $Pr \gg 1$ )	446
10.2.3	The two-dimensional solution of the Rayleigh–Bénard problem	448
10.2.3.1	An approximate calculation of the instability threshold	448
10.2.3.2	The domain of instability as a function of the wave vector	452
10.2.3.3	Amplitude variations as a function of distance above the threshold	453
10.3	Other examples of threshold instabilities	455
10.3.1	The Taylor–Couette instability	455
10.3.2	The Bénard–Marangoni instability	459
10.4	Other classes of instability	462
10.4.1	The Kelvin–Helmholtz instability	463
10.4.1.1	Cases where the surface tension and the difference in density can be neglected	465
10.4.1.2	Effects due to surface tension and differences in density	467
10.4.2	Poiseuille flow in a tube, and between parallel plates	469
10.4.3	The role of the shape of the velocity and vorticity profiles	470
	Appendix A1: transition to chaos	471
	Appendix A2: experiments in fully developed turbulence	476

A2.1	Two-dimensional flows	477
A2.2	Three-dimensional flows	479
<b>Appendix</b>	<b>Superfluid helium: an (almost) ideal fluid</b>	<b>482</b>
A.1	Important properties of Helium II at finite temperatures	482
A.1.1	The two-fluid model for Helium II	482
A.1.2	Quantization of the circulation of the superfluid velocity $\mathbf{v}_s$	483
A.1.3	Experimental evidence for the existence of a superfluid component flowing with no energy dissipation	484
A.1.3.1	Superfluid helium films	484
A.1.3.2	Flow through extremely small holes (10 $\mu\text{m}$ or less)	484
A.1.3.3	Persistent currents	484
A.2	Vortices in superfluid helium	485
A.2.1	The existence of vortex filaments in superfluid helium	485
A.2.2	Setting a volume of superfluid helium in rotation	485
A.2.3	Experimental evidence for the quantisation of circulation in superfluid helium: the Hall and Vinen experiment	486
A.2.4	Dynamics of vortex rings in superfluid helium	488
