
CONTENTS

Preface	xiii
I Nonlinear Continuum Mechanics	1
1 Kinematics of Deformable Bodies	3
1.1 Motion	4
1.2 Strain and Deformation Tensors	7
1.3 Rates of Motion	10
1.4 Rates of Deformation	13
1.5 The Piola Transformation	15
1.6 The Polar Decomposition Theorem	19
1.7 Principal Directions and Invariants of Deformation and Strain	20
1.8 The Reynolds' Transport Theorem	23
2 Mass and Momentum	25
2.1 Local Forms of the Principle of Conservation of Mass . .	26
2.2 Momentum	28
3 Force and Stress in Deformable Bodies	29
4 The Principles of Balance of Linear and Angular Momentum	35
4.1 Cauchy's Theorem: The Cauchy Stress Tensor	36

4.2	The Equations of Motion (Linear Momentum)	38
4.3	The Equations of Motion Referred to the Reference Configuration: The Piola–Kirchhoff Stress Tensors	40
4.4	Power	42
5	The Principle of Conservation of Energy	45
5.1	Energy and the Conservation of Energy	45
5.2	Local Forms of the Principle of Conservation of Energy .	47
6	Thermodynamics of Continua and the Second Law	49
7	Constitutive Equations	53
7.1	Rules and Principles for Constitutive Equations	54
7.2	Principle of Material Frame Indifference	57
7.2.1	Solids	57
7.2.2	Fluids	59
7.3	The Coleman–Noll Method: Consistency with the Second Law of Thermodynamics	60
8	Examples and Applications	63
8.1	The Navier–Stokes Equations for Incompressible Flow .	63
8.2	Flow of Gases and Compressible Fluids: The Compressible Navier–Stokes Equations	66
8.3	Heat Conduction	67
8.4	Theory of Elasticity	69
II	Electromagnetic Field Theory and Quantum Mechanics	73
9	Electromagnetic Waves	75
9.1	Introduction	75
9.2	Electric Fields	75
9.3	Gauss’s Law	79
9.4	Electric Potential Energy	80
9.4.1	Atom Models	80
9.5	Magnetic Fields	81

9.6	Some Properties of Waves	84
9.7	Maxwell's Equations	87
9.8	Electromagnetic Waves	91
10	Introduction to Quantum Mechanics	93
10.1	Introductory Comments	93
10.2	Wave and Particle Mechanics	94
10.3	Heisenberg's Uncertainty Principle	97
10.4	Schrödinger's Equation	99
10.4.1	The Case of a Free Particle	99
10.4.2	Superposition in \mathbb{R}^n	101
10.4.3	Hamiltonian Form	102
10.4.4	The Case of Potential Energy	102
10.4.5	Relativistic Quantum Mechanics	102
10.4.6	General Formulations of Schrödinger's Equation	103
10.4.7	The Time-Independent Schrödinger Equation . .	104
10.5	Elementary Properties of the Wave Equation	104
10.5.1	Review	104
10.5.2	Momentum	106
10.5.3	Wave Packets and Fourier Transforms	109
10.6	The Wave–Momentum Duality	110
10.7	Appendix: A Brief Review of Probability Densities . . .	111
11	Dynamical Variables and Observables in Quantum Mechanics: The Mathematical Formalism	115
11.1	Introductory Remarks	115
11.2	The Hilbert Spaces $L^2(\mathbb{R})$ (or $L^2(\mathbb{R}^d)$) and $H^1(\mathbb{R})$ (or $H^1(\mathbb{R}^d)$)	116
11.3	Dynamical Variables and Hermitian Operators	118
11.4	Spectral Theory of Hermitian Operators: The Discrete Spectrum	121
11.5	Observables and Statistical Distributions	125
11.6	The Continuous Spectrum	127
11.7	The Generalized Uncertainty Principle for Dynamical Variables	128
11.7.1	Simultaneous Eigenfunctions	130

12 Applications: The Harmonic Oscillator and the Hydrogen Atom	131
12.1 Introductory Remarks	131
12.2 Ground States and Energy Quanta: The Harmonic Oscillator	131
12.3 The Hydrogen Atom	133
12.3.1 Schrödinger Equation in Spherical Coordinates	135
12.3.2 The Radial Equation	136
12.3.3 The Angular Equation	138
12.3.4 The Orbitals of the Hydrogen Atom	140
12.3.5 Spectroscopic States	140
13 Spin and Pauli's Principle	145
13.1 Angular Momentum and Spin	145
13.2 Extrinsic Angular Momentum	147
13.2.1 The Ladder Property: Raising and Lowering States	149
13.3 Spin	151
13.4 Identical Particles and Pauli's Principle	155
13.5 The Helium Atom	158
13.6 Variational Principle	161
14 Atomic and Molecular Structure	165
14.1 Introduction	165
14.2 Electronic Structure of Atomic Elements	165
14.3 The Periodic Table	169
14.4 Atomic Bonds and Molecules	173
14.5 Examples of Molecular Structures	180
15 Ab Initio Methods: Approximate Methods and Density Functional Theory	189
15.1 Introduction	189
15.2 The Born–Oppenheimer Approximation	190
15.3 The Hartree and the Hartree–Fock Methods	194
15.3.1 The Hartree Method	196
15.3.2 The Hartree–Fock Method	196
15.3.3 The Roothaan Equations	199

15.4	Density Functional Theory	200
15.4.1	Electron Density	200
15.4.2	The Hohenberg–Kohn Theorem	205
15.4.3	The Kohn–Sham Theory	208

III Statistical Mechanics 213

16	Basic Concepts: Ensembles, Distribution Functions, and Averages	215
16.1	Introductory Remarks	215
16.2	Hamiltonian Mechanics	216
16.2.1	The Hamiltonian and the Equations of Motion . .	218
16.3	Phase Functions and Time Averages	219
16.4	Ensembles, Ensemble Averages, and Ergodic Systems . .	220
16.5	Statistical Mechanics of Isolated Systems	224
16.6	The Microcanonical Ensemble	228
16.6.1	Composite Systems	230
16.7	The Canonical Ensemble	234
16.8	The Grand Canonical Ensemble	239
16.9	Appendix: A Brief Account of Molecular Dynamics . .	240
16.9.1	Newtonian’s Equations of Motion	241
16.9.2	Potential Functions	242
16.9.3	Numerical Solution of the Dynamical System . .	245
17	Statistical Mechanics Basis of Classical Thermodynamics	249
17.1	Introductory Remarks	249
17.2	Energy and the First Law of Thermodynamics	250
17.3	Statistical Mechanics Interpretation of the Rate of Work in Quasi-Static Processes	251
17.4	Statistical Mechanics Interpretation of the First Law of Thermodynamics	254
17.4.1	Statistical Interpretation of \dot{Q}	256
17.5	Entropy and the Partition Function	257
17.6	Conjugate Hamiltonians	259
17.7	The Gibbs Relations	261

17.8 Monte Carlo and Metropolis Methods 262
17.8.1 The Partition Function for a Canonical Ensemble 263
17.8.2 The Metropolis Method 264
17.9 Kinetic Theory: Boltzmann's Equation of
Nonequilibrium Statistical Mechanics 265
17.9.1 Boltzmann's Equation 265
17.9.2 Collision Invariants 268
17.9.3 The Continuum Mechanics of Compressible
Fluids and Gases: The Macroscopic Balance
Laws 269

Exercises **273**

Bibliography **317**

Index **325**
