Preface	v
List of contributors	ix
Section 1. The microcomputer	
Chapter 1. Scope of microcomputers in clinical science and medicine: a current and future perspective by R.E. Smith and W. Malyj Jr.	3
1. Introduction	3
2. Applications of microcomputers in clinical medicine	4
3. Communication and networking options and requirements	7
4. Microcomputer architectures	8
5. Maximum performance from today's microcomputers	13
References	22
Chapter 2. Communicating with small computers by M.J. Geisow	25
1. Introduction	25
2. Anatomy of microcomputers	25
2.1. Nature of microprocessor data	26
2.2. Nature of microcomputer data	27
2.3. The microprocessor	28
2.4. Operating systems	30
3. Microcomputer memories	33
4. The use of files	35
5. Interfacing to microcomputers	36
5.1. Compatibility of devices for data exchange	36
5.2. Electrical and mechanical requirements	37
5.3. Bus protocol	37
5.4. Serial transmission of data	39
5.5. User ports (parallel interfaces) and single bit ports	41
6. Analogue-to-digital conversion	41
6.1. Resolution	42

6.2.	Conversion speed	43
6.3.	On-line processing of ADC data	43
7.	Interactive peripherals	44
8.	Microcomputer networks	45
8.1.	Cambridge ring	45
8.2.	Ethernet	47
Appendix 1. High-level microcomputer languages		48
Appendix 2. Interface (bus) standards		50
References		51

Section 2. Database systems

Chapter 3. Principles of database management by J. Staddon		55
1.	Introduction	55
1.1.	Database structures	55
1.2.	Logical and physical data representation	56
1.3.	Flat files	58
1.4.	Data independence	59
1.5.	Summary	61
2.	Designing a database	62
3.	Maintaining a database	67
3.1.	Indexes	67
3.2.	Adding, deleting and packing	69
3.3.	Entropy: the heat-death of a database	69
3.4.	Changing data file structure	72
3.5.	Summary	72
4.	A simple data file management system	73
4.1.	Automating basic database functions: entry and query	74
4.2.	Program EDIT	75
4.3.	Program GEN	76
4.4.	Summary	81

Chapter 4. Graphical interaction with small databases by C.E.H. Scott-Conner and H.F. Conner		83
1.	Introduction	83
2.	The hybrid programming approach	84
2.1.	Precisely what data is significant?	85
2.2.	Creation of programs in functional units	87
2.3.	Design of dBASE-II file structure	89

2.4.	Graphics programming – generation of matrix	91
2.5.	Graphics programming – creation of symbols for overlay onto matrix	92
2.6.	Symbol as cursor	94
2.7.	Temporary file	94
2.8.	Data retrieval and report generation	94
2.9.	Systems software and hardware	95
3.	Endoscopy record storage	95
3.1.	Hybrid programming approach	96
4.	Burn patient database	98
4.1.	Burn wound mapping system	99
4.2.	Hybrid family of programs	100
4.3.	Quantitation of rate of healing	100
5.	Discussion	103
	Appendix 1. Listing of data entry module for flexible sigmoidoscopy	103
	Appendix 2. Addresses and sources	111
	Acknowledgements	111
	References	111
	 Chapter 5. Microcomputers in infection control by W.S. Wise	 115
1.	Introduction	115
2.	IC database description and organisation	116
2.1.	File structures	116
2.2.	Rapid access techniques	118
2.3.	Data compression techniques	119
2.4.	The menu approach	120
2.5.	System files	121
2.6.	Demographic data	121
2.7.	Nosocomial status	122
2.8.	Organism data methods	122
2.9.	Sensitivity data	123
2.10.	Incomplete information methods	125
3.	Data entry screens	125
4.	Data editing features	126
5.	Report generators	127
5.1.	Site and sensitivity reports	127
5.2.	Detailed line reports	127
5.3.	Tabular statistical reports	130
6.	Database maintenance	130
7.	Future trends	131
	References	131

Section 3. Expert systems

Chapter 6. Software applications for nursing: education and decision-support systems by S. Evans	135
1. Contending systems and analysis criteria	135
1.1. Introduction	135
1.2. Criteria of analysis	135
1.3. Brief overview of several support systems for nursing care	137
2. The COMMES nursing decision-support system	141
2.1. Introduction	141
2.2. COMMES knowledge base	142
2.3. Accessing the knowledge base	142
2.4. COMMES as a personal tutor and clinical consultant	143
2.5. Standards of care	145
2.6. The Evaluation Consultant for continuing education	149
2.7. Testwriter Consultant	153
2.8. COMMES and systems design criteria	155
2.9. Systems specifications and portability of COMMES	156
Acknowledgement	158
References	158
Chapter 7. Microcomputers in neurology by G. Banks	159
1. Introduction	159
2. Database management	160
3. Basic neurosciences	161
3.1. Vision research	161
3.2. Neuroanatomy	162
3.3. Neurophysiology	162
4. Clinical neurophysiology	162
5. Education	163
6. Artificial intelligence	165
6.1. Rule-based systems	167
6.2. INTERNIST-1	168
6.3. Neurologic diagnosis	170
6.4. CADUCEUS	173
6.5. Other neurologic expert systems	174
6.6. Therapy	175
7. Neuroimaging	175
8. Videodisc technology	179
Appendix	181
References	182

Chapter 8. Microcomputers in psychiatric assessment	
by K.S. Mathisen	185
1. Introduction	185
2. Computerised psychological assessment	186
2.1. Criticisms	187
2.2. The future	187
3. Interactive interviewing	188
3.1. Criticisms	189
4. Computerised psychiatric diagnosis	190
4.1. Criticisms of early efforts	190
4.2. Improving prospects	191
5. Interactive psychiatric diagnosis: the NIMH-Diagnostic Interview Schedule (DIS)	193
5.1. Description of the interview software	199
5.2. Evaluation	199
6. Will the computer replace the clinician?	200
Acknowledgements	201
Appendix: Software availability	201
References	201

Section 4. Physiological monitoring and control

Chapter 9. Microcomputer-assisted evaluation of foetal well-being	
by M.Y. Divon	207
1. Introduction	207
2. Foetal biophysical activities: measure of foetal well-being	208
2.1. Foetal cardiac activity	209
2.2. Human foetal movements	209
2.3. Antepartum testing: multiple activity assessment	210
3. Computerised foetal monitoring system	210
3.1. General	210
3.2. Pulse shaping	212
3.3. Program design	213
3.4. Input sampling	213
3.5. Event timing	213
3.6. Data analysis	214
3.7. Error detection system	216
3.8. Data output	216
3.9. Data storage	217

4.	Clinical application	218
4.1.	Foetal breathing and associated changes in heart rate and beat-to-beat variability	218
4.2.	Foetal body movements and associated changes in heart rate and beat-to-beat variability	219
4.3.	Respiratory sinus arrhythmia in the human foetus	219
4.4.	Foetal breathing and maternal administration of glucose	219
5.	Conclusions	220
	Acknowledgements	221
	References	221
 Chapter 10. Ultrasonic image analysis by D. Nicholas		223
1.	Introduction	223
2.	Diagnostic ultrasound methods	225
3.	Tissue characterisation	226
4.	A-scan-related techniques	228
4.1.	Structural assessments	230
5.	B-scan imaging	233
5.1.	Pre-processing	233
5.2.	Post-processing	234
5.3.	Simple image measurement	235
5.4.	Image enhancement	235
5.5.	Image quantitation	237
6.	Structural assessment	240
7.	Tissue dynamics	242
8.	Other techniques	243
9.	Conclusion	244
	References	244
 Chapter 11. Microcomputers in anaesthesiology by J.A. Bushman		249
1.	Introduction	249
2.	Teaching	250
3.	Data logging and management	250
3.1.	Logging	250
3.2.	Management	253
4.	Measurement and calculation	254
4.1.	Feeding programs	255
5.	Monitoring	256
6.	Open loop control	257
7.	Closed loop control	257
7.1.	Patient demand pain relief	258

7.2.	Control of ventilators	258
7.3.	Control of neuromuscular relaxation	258
7.4.	Control of the depth of anaesthesia	258
8.	Ethical considerations	259
8.1.	Systems used to aid patient management but not connected to the patient	259
8.2.	Systems connected to the patient but not using closed loop control	259
8.3.	Systems connected to the patient and using closed loop control	260
	References	260

Chapter 12. Microcomputers in intensive care by L. Martin and B. Jeffreys 263

1.	Introduction	263
2.	A general view	264
2.1.	Data management	265
2.2.	Data interpretation	267
2.3.	Computer-assisted instruction (CAI)	268
2.4.	Computer-assisted diagnosis (CADx)	269
2.5.	Computer-assisted therapy (CARx)	269
3.	Our work	271
4.	The future	272
	Appendix 1. Description of ICU programs	274
	Appendix 2. Commercial sources of ICU software	277
	References	277

Chapter 13. NEURONET: a distributed microprocessor network for clinical neurophysiology by R.J. Sclabassi, R.M. Lofink and E. Doyle 283

1.	Introduction	283
2.	Operational requirements	284
3.	Hardware and software considerations	287
3.1.	Microprocessor system	287
3.2.	Network hardware	289
3.3.	Operating system environment	290
3.4.	Network support software	291
4.	An application program	291
5.	Neurophysiological applications	294
5.1.	Signal processing	295
5.2.	Diagnostic studies	295
5.3.	Intraoperative monitoring	297
5.4.	Research applications	299

6. Discussion	301
References	302

Section 5. Consultancy and general practice

Chapter 14. Microcomputers in paediatrics by J.S.H. Tay 307

1. Introduction	307
2. An overview	307
3. Type of microcomputer and software	309
4. Computer programs for genetic counselling	310
4.1. Some definitions	310
4.2. Computer program for counselling sex-linked diseases	311
5. Quantitative analysis of the electrocardiogram in children	315
5.1 Calculation of the heart rate	317
5.2. Calculation of the Q-T interval	318
5.3. Determination of the mean frontal plane axis	318
5.4. Detection of ventricular hypertrophy	319
5.5. Comments on the computer program	319
6. Computer program to calculate oxygen availability in cyanotic congenital heart disease	321
6.1. Computation of p50 standard	322
6.2. Computation of p50 in vivo	323
7. Computerisation of the leukaemia registry	324
7.1. The main menu	324
8. Computer program for total parenteral nutrition in children	329
9. Computer program for the diagnosis of acid-base disorders	332
9.1. Fundamental concepts	335
References	338

Chapter 15. 10 years experience with integrated general practice by A. Dean and J. Boda 341

1. Background	341
2. Key areas	343
2.1. Multiuser function	343
2.2. Multitasking	343
2.3. Simplicity of operation	343
2.4. Speed	343
3. Dictionaries	344
3.1. Location	344
3.2. Individual patient	344

3.3.	Family groups	344
3.4.	Problems	345
3.5.	Drugs	345
3.6.	Interactions and contra-indications	346
3.7.	Occupations	346
4.	Individual modules	346
4.1.	Registration of families	346
4.2.	Therapy	347
4.3.	History summaries	348
4.4.	Appointments	350
4.5.	Prevention	351
4.6.	Output (reports)	352
4.7.	Consultation	353
4.8.	Dispensing	353
4.9.	Audit	354
4.10.	Word processing	354
4.11.	Morbidity	354
5.	Design	355
5.1.	Batch or real-time processing	355
5.2.	Helpful screens	356
6.	Access to data	356
7.	Programming	357
7.1.	Codes and coding	357
7.2.	Hardware, operating system and language	359
8.	Epidemiological analysis	359
8.1.	Basic demography of practice	361
8.2.	Hypertension	365
8.3.	Myocardial infarction	366
8.4.	Changing medical practice	367
8.5.	Hypothesis testing	371
9.	Security and data protection	373
10.	Subsequent development	374
11.	Conclusions	374
	Acknowledgements	375
	References	375

Chapter 16. Microcomputers for severely physically handicapped persons	by W.J. Perkins	377
1.	Introduction	377
2.	Effects of disabilities	377
3.	Development procedure	378
3.1.	Choice of equipment	378

3.2.	User requirements	379
3.3.	Control of computer	379
4.	Communication	381
4.1.	Character menus	381
4.2.	User-adaptive procedures	381
4.3.	Letter writing	383
5.	Consideration of menu systems and scanning systems	384
6.	Conclusions	384
	References	384

Section 6. Programming tools and aids in clinical medicine

Chapter 17. Fourier and Walsh transformations: their application to the analysis of biomedical data by microcomputer

by A.N. Barrett and P.B. Pynsent

389

1.	Fourier transforms	389
1.1.	The fast Fourier transform (FFT)	392
1.2.	Computation of inverse Fourier transforms	394
2.	The Walsh transform	394
2.1.	General formulation	395
2.2.	Relationship to the FFT	396
3.	Computing the transform of real arrays	396
4.	Some hints on using the transforms	398
4.1.	Data acquisition	398
4.2.	Trends	399
4.3.	Aliasing	399
	Appendix: Program listings	399
	References	407

Chapter 18. Microcomputers in endocrinology by R.L. Patience and R.A. Biddlecombe

409

1.	Introduction	409
2.	Microcomputers in immunoassay	410
2.1.	Theory of immunoassay	410
2.2.	Quantitation in immunoassay	413
2.3.	The role of microcomputers	417
3.	Other applications of microcomputers	424
3.1.	Assay-related applications	424
3.2.	Non-assay applications	425
4.	Future developments	426
	References	426

Chapter 19. Microcomputers in orthopaedics by P.B. Pynsent and J.C.T. Fairbank	429
1. Introduction	429
2. Administration	429
3. Statistics	430
4. Measurement of form	430
4.1. Medical imaging	431
4.2. Vector stereography	431
4.3. Photogrammetry	432
4.4. Radiographic analysis	434
5. Gait analysis	435
6. Other applications	436
6.1. Expert systems	436
6.2. Muscle stimulation in paralysis	437
6.3. Biomechanics	438
6.4. Computerised interviewing	438
6.5. Bone densitometry	438
6.6. Hand assessment	438
7. Conclusion	438
References	439
Subject index	443
