

Contents

Part I. The Earth and the Moon in Astronomy

1. The Purpose of Astronomy 3
Why study astronomy? · Star study without a telescope · Astronomy with a small telescope · Our outlook upon the universe
2. The Earth in Astronomy. 19
Size and shape of the earth · Rotation of the earth on its axis · Revolution around the sun · Precession of the equinoxes · The interior of the earth · Magnetism of the earth · The atmosphere · The mass of the earth and the force of gravitation · Summary
3. Locating Stars on the Celestial Sphere 56
Location by means of coordinates · The horizon system · The equator system · The ecliptic system
4. Time and the Calendar 74
Time by the sun · The use of time in determining longitude · The time belts · The calendar · Geographic limits of the day · Greenwich hour angle
5. Celestial Navigation. 103
Position from the heavenly bodies · Maps and charts · The determination of position
6. The Astronomer's Equipment and Its Use 124
Lenses and images · The observatory and the telescope · Kinds of telescopes · Photography · Spectroscopy · Measuring heat and light
7. The Solar System 173
Parts of the solar system · Positions and motions · Introductory study of the sun · Velocity of light · Size and mass of the sun

8. The Moon 209
Distance · Motion of moon in its orbit · Results of the moon's mass and position · Surface features · Light changes and parts visible · Effects of the moon upon the earth
9. Eclipses of the Sun and Moon 239
Reason for eclipses · Phenomena of an eclipse · Prediction of eclipses · Series of eclipses and the saros · Eclipse problems for study · An eclipse expedition
10. The Tides 260
Their nature and cause · The less obvious tidal effects

Part II. The Physical Nature of the Sun and Planets

11. Light, Atoms, and Spectrum Lines 277
Early experiments with light · The Doppler principle · The structure of matter · The discovery of radioactivity · The structure of the atom · Spontaneous transmutation · Uranium fission · Origin of the quantum theory · The origin of spectrum lines · The new quantum theory
12. The Sun Considered as a Star 320
The sun among the stars · Structure of the solar atmosphere · Sunspot groups and their characteristics · Prominences · Solar corona · Solar and terrestrial relationships · Astronomical tests of the theory of relativity
13. The Terrestrial Planets 391
Mercury · Venus · Mars · Pluto
14. The Major Planets 421
Jupiter · Saturn · Uranus · Neptune · Theories of the origin of the solar system
15. Comets and Meteorites 453
Comets · Orbits of comets · Meteors · Effects of the meteorite's motion · Meteorites

Part III. The Stars and Nebulae

16. Star Distances 491
Comparisons and illustrations of distances · Stellar parallaxes · History of parallax work · Units of measurement
17. Differences Among the Stars 504
Brightness of stars · Size of stars · Differences in stellar spectra · Classification of stars · Spectra of dwarfs and giants · White dwarf stars · Variable stars · Supernovae

CONTENTS

xi

18.	The Real Motions of Stars	552
	Double or binary stars · Spectroscopic binaries · Multiple stars · New stars, “novae” · Star clusters · Star clouds · Solar motion · Galactic rotation	
19.	The Source of Stellar Energy	604
	Contraction theory · The evolution of stars	
20.	Galactic Nebulae and Other Inter-Stellar Material .	617
	Our stellar system and other systems · Diffuse and planetary Nebulae · Obscuring clouds · Interstellar gases	
21.	Galaxies	638
	Measuring distances to nebulae · The “red shift” or “apparent recession” of nebulae · Distribution and size of nebulae · Classification of nebulae · Cosmogony	
	Appendix	665
	Index	679
	Star maps	693
