

TABLE OF CONTENTS

	Page
PREFACE.	v
1. INTRODUCTORY DEFINITIONS AND CONCEPTS.	1
The Structure of High Polymers.	1
Seat of Special Properties of High Polymers.	3
Polymerization: Addition and condensation.	3
Investigational Difficulties	5
Degradation.	6
Molecular-weight Distribution	6
Functionality and Polymerization	8
Copolymerization and Heteropolymerization	15
Chemical Modification of High Polymers.	18
2. MOLECULAR FORCES.	20
Primary Valence Forces	20
Secondary Valence Forces.	28
Surface Effects	36
Forces Affecting a Molecular System: Attraction, repulsion, thermal agitation, external stress.	40
Factors Determining the Magnitude of Intermolecular Forces of Attraction: Molecular weight, polarity, symmetry, and orientation.	42
Factors Controlling Equilibrium and Rate: Equilibrium factors, rate factors, activation energy, relaxation	48
Crystallinity	54
Stress-induced Orientation	58
Comparison of Rubbers, Plastics, and Fibers.	60
The Effects of Cross-linkage.	61
The Effects of Copolymerization.	62
The Effects of Substitution on Cellulose	62
The Development of the Nylons.	65
3. SOME SPECIAL BEHAVIORS AND PROPERTIES OF HIGH POLY- MERS.	69
General Qualitative Aspects of Solubility.	69
Factors Affecting the Solution and Swelling of High Polymers: Effects of molecular weight, crystallinity, cross-linkage, polarity, chain flexibility, sym- metry, and branching	71
Viscosity, Solubility, and Gelation: Solvent action and shape of solute mole- cules—Relations between viscosity and solubility—Gelation phenomena: thixotropy	77

	Page
Plasticization: External and internal plasticization	82
Thermal Behavior: Melting points, flow temperatures, heat softening, and deformation—Behavior classification of high polymers—Thermoplasts, thermosets, and nonmoldable materials.	88
Mechanical Properties: Effects of molecular structure—Structural potentialities	94
4. POLYMER FORMATION AND MODIFICATION.	98
Condensation Polymerizations: Mechanism—Effect of structure of monomers, temperature, catalyst, solvent, monomer concentration—Carothers' equation—Size distribution in linear condensation polymers—Condensation space polymers	98
Addition Polymerizations: Vinyl polymers—Activation of double bonds by substituents—Mechanisms on vinyl polymerization—Vinyl polymerization and structure—Polymerization by ring scission—Size distribution in addition polymers—Control of vinyl and diene polymerizations—Effects of temperature, catalyst, and solvent—Effects of state of dispersion—bulk, solution, emulsion, and suspension polymerization—Copolymerization—General properties of vinyl polymerization products.	116
Polymerizations Involving Conjugated Unsaturation: Diels-Alder reaction, diene polymerizations, copolymerizations, carbon-oxygen conjugation. . . .	132
Chemical Modification of High Polymers.	137
Reactions of Cellulose: Swelling and dispersion, degradation, substitution . .	139
Reactions of Wool: Composition, amphoteric nature, cross linkage.	147
5. STRUCTURES OF HIGH POLYMERS	155
Optics and Microscope Resolving Power	156
X-ray Diffraction	158
Electron Microscopy and Electron Diffraction.	170
Phase Changes and Transition Effects: First-order and second-order transitions—Transition phenomena in high polymers—First-order and second-order transitions—The rubbery and glasslike states—The brittle point	175
Structures of Silicates and Silicones	193
Structures of Synthetic High Polymers.	200
Structures of Cellulose and Cellulosic Fibers.	205
Structures of Silk and Wool.	212
6. SOLUBILITY AND MOLECULAR-WEIGHT RELATIONS	218
Solutions of Low-molecular-weight Solutes.	219
Solutions of High-polymer Solutes: Effects of molecular volume and intermolecular forces.	226
Freezing Point and Solubility	228
Molecular Weights of High Polymers: Definitions of molecular weight—Osmotic, diffusion and sedimentation, viscosity, optical, and other methods.	235
Shapes of High-polymer Molecules.	255
7. RHEOLOGY.	257
General Considerations: Ideal elastic deformation, pure viscous flow, plastic flow	257
Engineering Definitions.	265

	Page
The Influence of Time: Relaxation.	270
Molecular Theory and Rheological Behavior: Crystalline solids—Low-molecular-weight liquids—Solutions and suspensions—Anomalous flow—Irreversible changes in consistency due to shear; dilatancy, thixotropy—Testing procedures and equipment—High-polymer solids—Stress-strain behavior, relaxation, creep, mechanical conditioning, superposition of creep	275
The Influence of Temperature.	307
 8. MOLDING AND MANIPULATION	 310
Mixes	310
Types and Functions of Compounding Ingredients: Binders, fillers, external plasticizers, catalysts, cross-linking agents, lubricants, solvents, coloring materials, surface-active agents	310
Molding, Forming, and Manipulation: Hot compression molding—Injection molding—Transfer molding—Extrusion—Spinning of synthetic fibers—High frequency or dielectric heating—Jet molding—Casting—Cold molding—Blowing—Emulsion processing and manipulation—Dipping—Electrodeposition—Production of film—Production of laminates—Production of expanded materials—Forming	323
 9. MECHANICAL PROPERTIES	 360
Elastic Modulus and Tensile Strength: Calculations from theory—Factors affecting tensile strength: intermolecular forces, molecular weight, orientation and crystallization, molecular-weight distribution, flaws, twist, plasticization, cross-linkage, rate of loading, temperature.	360
Static Structural Considerations: Strength balance, instability, strength-weight ratios, modulus-weight ratios	375
The Mechanical Behavior of Expanded Materials	382
Creep and Time-to-rupture Values.	383
Stress Concentration and Notch Effects.	391
Factors Affecting Properties of Binder-Filler Products	394
Native Wood	397
Methods for Improving Woods	403
Dynamic Properties: Impact resistance, behavior under cyclic stress, dynamic modulus of elasticity, damping capacity, fatigue.	409
Factors of Safety	426
 10. ELECTRICAL, THERMAL, AND OPTICAL PROPERTIES.	 428
Electrical Properties: Volume resistance, surface resistance, electrical breakdown, dielectrics, anomalous dispersion and dielectric absorption, low-loss insulators, dielectric heating.	428
Thermal Properties: Heat resistance, thermal conductivity, thermal expansion	452
Optical Properties: Interrelation of mechanical, electrical, thermal, and optical properties, color, refraction and reflection, effects of surface condition, birefringence and polarization, stability of optical properties, window materials, safety glass.	456

	Page
11. FIBERS AND FIBROUS PRODUCTS	465
Fibers: Classification, structure—Attributes of form and dimension—Mechanical properties of fibers—The disalignment tendency—Behavior toward moisture	466
Yarns	480
Fabrics: Hand, drying characteristics, shrinkage, ironing and boarding, warmth.	482
Felts: Paper, wool felts, dry felting, leather.	485
Textile Treatments: Polymerization of resins within fibers, treatments with cation-active compounds, mercerization, etc.	499
Permanent Waving of Hair.	507
12. RUBBERS.	510
General Procedure for Manufacture of Vulcanizates	510
Classification of Rubbery Materials	513
Molecular Structure and Rubberiness: Internal and external mobility; balance of factors required for true rubberiness.	515
Basic Methods for Attaining Rubberiness: External and internal plasticization, vulcanization	519
Reinforcement.	521
Oxidation and Aging of Rubber	522
Mechanisms of Vulcanization: Nonsulfur and sulfur vulcanizations.	525
Space Polymers Containing Tetrafunctional Branch Units.	530
Molecular Structure Versus Properties of Vulcanizates: Thermodynamic properties of rubber—Quantitative correlation of molecular structure with physical properties; degree of cross-linkage, stress-strain characteristics, swelling, ultimate tensile strength	534
13. RUBBERS (<i>Continued</i>)	552
Impurities in Raw Rubbers	552
Mastication and Milling	554
Sulfur Vulcanization: Soft and hard vulcanizates, vulcanization coefficient, effects of curing temperature and time, effects of accelerators and accelerator activators.	556
Loading: Factors affecting reinforcement by loading agents, carbons, choice of reinforcing carbon.	567
Resistance to Heat, Light, and Oxidation	571
Static Mechanical Properties: Static tensile properties, effects of mechanical conditioning.	573
Dynamic Properties: Dynamic relationships—The nature of the internal friction—Relation between dynamic and static modulus—Variations in dynamic modulus and internal friction—The effects of loading on dynamic properties—The dynamic resilience and damping capacity—Heat build-up—Flex failure.	577
Creep and Relaxation: Continuous relaxation under stress, intermittent relaxation, creep, correlation of creep and relaxation with rubber aging.	587
Other Mechanical Properties	592

	Page
Gas Permeability	592
Latex Processing	593
14. SURFACE COATINGS	595
Fundamental Types of Surface Coatings	595
Oleoresinous Varnishes: Composition of drying oils, reactions involved in drying, varnish resins, ester interchange, driers, varnish solvents.	596
Lacquers: Lacquer resins, plasticizers, binders, solvents and diluents.	603
Adhesion: Mechanical and specific (molecular) adhesion—Forces working against adhesion.	607
Drying Rates: Drying of varnishes and lacquers.	610
Gloss and Gloss Retention	611
Mechanical Properties of Detached Surface-coating Films	612
Flaws, Wrinkles, and Cracks	613
Pigments: Reactions between pigment and vehicle—The wetting and dispersion of pigment particles—Effects of pigments on flow properties—Pigments and optical properties—Effects of pigment concentration	615
The Service Life of Surface Coatings.	620
Polyester (Alkyd) Surface-coating Resins: Glyptal, maleic and other polyester surface-coating resins—Applications by type	620
Urea-aldehyde and Melamine-aldehyde Resins.	624
Urea-alkyd and Melamine-alkyd Coatings.	628
Water Paints: Casein, oleocasein, alkyd emulsion, and urea-aldehyde water paints	629
15. ADHESIVES.	634
Character of an Adhesive Joint.	634
Adhesion: Adhesion mechanisms and factors, surface forces, conditioning of the surface	635
Tackiness.	637
Cohesion: Setting of the adhesive, thickness of adhesive layer	639
Service Life of Adhesive Joints: Influence of coefficients of expansion, aging.	641
Character of the Adhesive: Keeping qualities, molecular-weight factors, volatiles and their release, setting characteristics.	642
Chemical Types of Adhesives	649
Adhesives for Wood	650
Adhesives for Metals.	651
Bonding of Organic Plastics.	652
16. RESIN PRODUCT DEVELOPMENT: PHENOLIC RESINS	655
Chemistry of the Phenol-aldehydes: Resinoid and resin formation, color characteristics.	655
The Manufacture of Commercial Phenolic Resins: Resins for hot compression molding, casting, for cloth and paper laminates, for wood, for making improved woods—Phenol-furfural resins—Resins for ion exchange and selective sorption	661
Phenolic Surface-coating Resins.	670

APPENDIX

	Page
A. Guide to the high-polymer literature.	675
Introduction to Appendixes B to E inclusive	680
B. Properties of fibers.	681
C. Properties of plastics.	684
D. Properties of rubbers.	691
E. Adhesion, compatibility, and solubility	695
Adhesion and compatibility, plasticizers, solvents	696
F. Chemical formulas and names of high polymers	709
 INDEX.	 715
