Preface 11

Symbols and units 13

Part I Foundations of estimation theory 15

- 1 Essence of the role of estimation and the fundamental problems of estimation theory 15
- 2 Development of estimation theory and its application to hydrology and water engineering 19
 - 2.1 Basic methods of the theory of estimation 19
 - 2.2 Methods of examination of the representativeness of sample characteristics based on comparative analysis 21
 - 2.3 Methods of parameter estimation based upon simulation models of random sequences 22
- 3 Sample characteristics. Their distribution 24
 - 3.1 Definition of characteristics. Their fundamental relationships to parameters 24
 - 3.2 Problems of the distribution of characteristics 37
 - 3.3 Estimators of autocorrelation function and spectral density. Problems of filtration 42
 - 3.4 Computation of point and interval estimates of parameters 59
- 4 Estimation of parameters by the moments method 65
 - 4.1 Principles of the moments method and the application of simulation models of random sequences to estimation 65
 - 4.2 Estimation of parameters of populations with various probability distributions 70
 - 4.2.1 Estimation of parameters of a population with log-normal distribution 71
 - 4.2.2 Estimation of parameters of a population with logarithmic Pearson distribution of the IIIrd type 78
 - 4.3 Mutual relationships between the random, probable and systematic errors of parameter estimation 86
 - 4.4 Effect of extreme sample elements on parameter estimation 95
- 5 Estimation of parameters by the method of maximum likelihood 102
 - 5.1 Brief review of the development of the method 102
 - 5.2 Principle of the method of maximum likelihood and the application of simulation models of random sequences to estimation 106

5.3	Estimation of parameters of populations with various probability distributions	108
5.3.1	Estimation of parameters of a population with Pearson's distribution of the IIIrd type	108
5.3.2	Estimation of parameters of a population with logarithmic Pearson distribution of the IIIrd type	111
5.3.3	Estimation of parameters of a population with normal and log-normal distributions	113
5.3.4	Estimation of parameters of a population with triparametric gamma distribution	115
5.4	Properties of parameter estimates of populations with various probability distributions	118
5.4.1	Properties of parameter estimates of a population with Pearson's distribution of the IIIrd type	118
5.4.2	Properties of parameter estimates of a population with logarithmic Pearson distribution of the IIIrd type	120
5.4.3	Properties of parameter estimates of a population with a log-normal distribution	121
5.4.4	Properties of parameter estimates of a population with a triparametric gamma distribution	123
6	Estimation of parameters by the quantiles method	126
6.1	Principle of the quantiles method and the application of simulation models of synthetic sequences to estimation	126
6.2	Properties of parameter estimates of populations with various probability distributions	132
6.2.1	Properties of parameter estimates of a population with Pearson's IIIrd type distribution	132
6.2.2	Properties of parameter estimates of a population with log-normal distribution	135
7	Analysis of time series, and their mathematical modelling	136
7.1	Fundamental problems of the analysis of time series	136
7.2	Basic models of time series	140

Part II Application of estimation theory to hydrology and water engineering 149

8	Parameter estimation of series of maximum flood flows	149
8.1	Fundamental problems of processing N -year flows	149
8.2	Probability properties of intervals between culminating flows	154
9	Estimation of parameters of average annual flow series	157
9.1	Estimation of parameters of probability distribution	157
9.2	Problems of estimation of the autocorrelation function	163
10	Estimation of parameters of average monthly flow series	167
10.1	Estimation of parameters of probability distribution	167
10.2	Problems of estimation of the autocorrelation function	173
10.3	Estimation of the coefficients of correlation between the average flow series in calendar months	176
10.4	Problems of generating random samples from flow series	177
11	Automated parameter estimation and computer-aided modelling of random hydrological series	182
11.1	Automated computer-aided estimation of parameters	182

11.2	The linear regression stochastic model and its modifications	186
11.3	Modelling of random hydrological series with respect to the bias of the characteristics of the given real sample	190
12	Application of the theory of estimation to the design of storage reservoirs	196
12.1	Long-term stationary function of storage reservoirs	196
12.2	Designing storage reservoirs using sets of short realizations of flow series	210
12.3	Effect of the estimation of the autocorrelation function of flow series on the computation of the design parameters of storage reservoirs	223
12.4	Relationship between estimation theory and optimum control of reservoirs in real time	233
12.4.1	Basic problems of optimum control of reservoirs in real time	233
12.4.2	Possibility of applying the principle of adaptivity to the control of reservoirs in real time	235
12.4.3	Properties of parameter estimates of adaptive control of seasonal reservoirs in real time	243
12.5	Estimation of future climatic changes and their effect upon hydrologic regimes and water management in water resource systems	255
13	Prospects of the development of estimation theory	257
