

CONTENTS

INTRODUCTION	xi
CHAPTER I: THE SCHRÖDINGER EQUATION	1
1. The wave nature of matter	1
1.1. Interaction of matter and radiation	1
1.2. Wave properties of material particles	6
1.3. Connexion with Newtonian mechanics	9
2. The wave equation of Schrödinger	12
3. Motion of electrons in one dimension	13
3.1. The effect of potential jumps on the motion of an electron	13
3.2. The tunnel effect	15
3.3. The WKB method	19
3.4. The transparency of potential barriers by WKB method	22
4. Frequency and group velocity of the waves associated with material particles	24
5. The wave equation for non-stationary phenomena	27
6. The uncertainty principle	30
7. Wave functions for the momentum of a particle	34
8. Hamiltonian equations of motion	37
CHAPTER II: STATIONARY STATES	41
9. The old quantum theory	41
9.1. Rotation of the nucleus about the centre of gravity	44
9.2. Structure of atoms other than hydrogen	45
9.3. Rotational energy levels of molecules	45
9.4. Vibrational energy	46
10. The concept of stationary states in wave mechanics	46
10.1. Quantization with several degrees of freedom	48
10.2. Electron moving in a closed path	49
11. Wave functions for the simple harmonic oscillator	50
11.1. The simple harmonic oscillator in one dimension	50
11.2. The bounded harmonic oscillator	53
11.3. The simple harmonic oscillator in three dimensions	53
12. Wave mechanical treatment of the hydrogen atom	54
12.1. Interpretation of the wave functions	58
12.2. The momentum density functions	59
12.3. The continuous spectrum	60
13. The rigid rotator	60
14. Schrödinger's equation in invariant form	61
14.1. Symmetrical top molecules	61
CHAPTER III: PROPERTIES OF THE WAVE FUNCTIONS	64
15. The orthogonal property	64
15.1. Expansion of an arbitrary function in terms of wave functions	65
16. Transformation functions	66
16.1. Formulation of problems in momentum space	68
17. The elements of perturbation theory	71
17.1. Perturbation theory for non-degenerate states	71

CHAPTER I: THE SCHRÖDINGER EQUATION	1
1. The wave nature of matter	1
1.1. Interaction of matter and radiation	1
1.2. Wave properties of material particles	6
1.3. Connexion with Newtonian mechanics	9
2. The wave equation of Schrödinger	12
3. Motion of electrons in one dimension	13
3.1. The effect of potential jumps on the motion of an electron	13
3.2. The tunnel effect	15
3.3. The WKB method	19
3.4. The transparency of potential barriers by WKB method	22
4. Frequency and group velocity of the waves associated with material particles	24
5. The wave equation for non-stationary phenomena	27
6. The uncertainty principle	30
7. Wave functions for the momentum of a particle	34
8. Hamiltonian equations of motion	37
CHAPTER II: STATIONARY STATES	41
9. The old quantum theory	41
9.1. Rotation of the nucleus about the centre of gravity	44
9.2. Structure of atoms other than hydrogen	45
9.3. Rotational energy levels of molecules	45
9.4. Vibrational energy	46
10. The concept of stationary states in wave mechanics	46
10.1. Quantization with several degrees of freedom	48
10.2. Electron moving in a closed path	49
11. Wave functions for the simple harmonic oscillator	50
11.1. The simple harmonic oscillator in one dimension	50
11.2. The bounded harmonic oscillator	53
11.3. The simple harmonic oscillator in three dimensions	53
12. Wave mechanical treatment of the hydrogen atom	54
12.1. Interpretation of the wave functions	58
12.2. The momentum density functions	59
12.3. The continuous spectrum	60
13. The rigid rotator	60
14. Schrödinger's equation in invariant form	61
14.1. Symmetrical top molecules	61
CHAPTER III: PROPERTIES OF THE WAVE FUNCTIONS	64
15. The orthogonal property	64
15.1. Expansion of an arbitrary function in terms of wave functions	65
16. Transformation functions	66
16.1. Formulation of problems in momentum space	68
17. The elements of perturbation theory	71
17.1. Perturbation theory for non-degenerate states	71

CONTENTS

vii

17.2. Matrix elements	72
17.3. Perturbation theory for degenerate systems	72
18. The Rayleigh-Schrödinger method	73
18.1. Unperturbed system non-degenerate	73
18.2. Degenerate systems	75
18.3. A modified form of the Schrödinger theory	77
18.4. The Lennard-Jones form of perturbation theory	78
18.5. Rotating polar molecules in an electric field	80
18.6. The Wigner perturbation method	81
CHAPTER IV: EFFECT OF A MAGNETIC FIELD AND THE ELECTRONIC SPIN	84
19. Effect of a magnetic field on the energy levels of atoms	84
19.1. Effect of a magnetic field	84
19.2. Orbital angular momentum	85
19.3. The total angular momentum	86
19.4. Energy levels in a magnetic field	87
20. The electronic spin	89
20.1. Doublets of the alkali atoms and anomalous Zeeman effect	91
21. Wave functions for the spin	92
21.1 Matrix mechanics	94
21.2. Matrices for the spin moment	96
21.3. Pauli's wave equation for an electron with spin	98
22. Evaluation of the doublet separation in alkali atoms and the anomalous Zeeman effect	100
CHAPTER V: THE TWO-BODY PROBLEM	102
23. Introduction	102
23.1. The hydrogen atom with motion of the nucleus	102
23.2. Rotational and vibrational states of the diatomic molecule	103
24. Symmetry characteristics of the wave functions	105
24.1. Introduction of the spin coordinates	108
24.2. Application to diatomic molecules	110
24.3. The helium atom: general principles	112
24.4. Collisions between identical particles	113
24.5. The Pauli principle	117
25. The helium atom: methods of obtaining wave functions	118
25.1. Perturbation method of obtaining energy levels	118
25.2. Choice of the field $V(r)$; the Hartree method of the self-consistent field	119
25.3. The Fock equation	122
26. The deuteron	122
CHAPTER VI: ATOMS WITH MANY ELECTRONS	127
27. The wave functions of many-electron systems	127
27.1. The Schrödinger equation in atomic units	127
27.2. The wave functions of many-electron atoms	128
27.3. The electron distribution function of a many-electron system	131
27.4. The energy of a many-electron system	133
28. Variational methods of determining wave functions and energy levels of many-electron atoms	135
28.1. Fock's variational equations	135
28.2. Hartree's method of the self-consistent field	138
28.3. Solutions of the Hartree-Fock equations	139
28.4. Analytical atomic wave functions	142

29. The perturbation method of determining approximate wave functions of atoms	145
29.1. Non-degenerate cases	145
29.2. Degenerate cases	148
29.3. Slater's method for complex atoms	151
30. The statistical method of Thomas and Fermi	156
CHAPTER VII: INTERATOMIC FORCES	162
31. Introduction	162
31.1. Rotation and vibration of diatomic molecules in their lowest electronic states	162
31.2. Review of types of interatomic force	164
32. Van der Waals' forces	164
32.1. Calculation of van der Waals' forces by classical methods	164
32.2. Polarizability of an atom in an electric field	166
32.3. The f -sum rule	169
32.4. Calculation based on wave mechanics	170
32.5. The calculation of the van der Waals constant from observed polarizabilities	174
33. Overlap forces	175
33.1. Detailed discussion of the hydrogen molecule by London-Heitler method	178
33.2. Improvements in the approximation of London and Heitler	181
33.3. Some other applications of the London-Heitler method	182
33.4. The hydrogen molecule by the method of molecular orbitals	183
34. Distribution of momentum in the hydrogen molecular ion	190
35. Qualitative results for more complex molecules	192
35.1. The principle of maximum overlapping	192
35.2. Carbon molecules: hybridization of wave functions	194
35.3. The ethylene double-streamers	197
35.4. The benzene molecule	198
CHAPTER VIII: THEORY OF SOLIDS	201
36. Cohesive forces in ionic crystals	201
37. Crystals in thermal equilibrium	204
37.1. Lattice vibrations	204
37.2. Vacant lattice points and interstitial ions	205
38. Electronic motion in crystals	207
38.1. Motion in a periodic field	208
39. Conductors and insulators	214
40. Applications of the collective electron model to metals	215
40.1. Emission and absorption of soft X-rays	215
40.2. Specific heats	216
40.3. Paramagnetism	217
40.4. Thermionic emission	218
40.5. Cold emission	219
40.6. Metallic cohesion	220
40.7. Electrical conductivity	222
41. Electronic motion in non-metals	223
41.1. Semi-conductors	224
41.2. Optical properties of impure crystals	226
41.3. Photo-conductivity	226
41.4. Optical properties of pure crystals; the exciton	227
41.5. Contact between a metal and an insulator	229
41.6. Contact between a metal and a semi-conductor	230

CHAPTER IX: COLLISION PROBLEMS	233
42. Introduction	233
43. Scattering by a centre of force	234
43.1. Exact solution of the wave equation representing an incident and a scattered wave	235
44. Born's approximation for the scattering of particles by a centre of force: alternative treatment	239
44.1. Scattering by a Coulomb field	241
44.2. Collisions between electrons and atoms	242
44.3. Relative intensities of elastically and inelastically scattered particles	245
CHAPTER X: INTERACTION OF RADIATION WITH MATTER	247
45. Introduction	247
45.1. Excitation of atoms by a passing α -particle	248
45.2. Transitions to unquantized states	249
45.3. Transitions due to a perturbation periodic in the time	250
45.4. Transitions caused by a perturbing term independent of the time	252
46. Emission and absorption of radiation	253
46.1. Elementary theory of absorption	255
46.2. Selection rules	257
46.3. Alternative treatment of emission	258
47. Proper treatment of the radiation problem: quantization of the field	259
47.1. Hamiltonian of the complete system	262
47.2. Calculation of the matrix elements	263
48. First-order radiation processes	265
48.1. The emission of radiation	265
48.2. The photoelectric effect	266
48.3. The breadth of spectral lines	268
49. Radiation processes of higher order	272
50. Radiation damping	275
50.1. Classical theory of radiation damping	275
50.2. Quantum theory of radiation damping	280
50.3. Solution of the radiation equations for direct transitions	282
50.4. Transitions through intermediate states	284
50.5. Solutions of the integral equations	286
CHAPTER XI: RELATIVISTIC QUANTUM MECHANICS	290
51. Introduction	290
52. Scalar relativistic wave equations	292
52.1. The Hamiltonian for the relativistic motion of an electron	292
52.2. Approximate relativistic equations	293
52.3. The Klein-Gordon equation	295
53. The Dirac wave equation for an electron	296
53.1. The Dirac equation for an arbitrary field	296
53.2. The Dirac matrices	298
53.3. The relativistic invariance of the Dirac equations	300
53.4. The spin of the electron	303
53.5. The quantization of the total angular momentum	306
53.6. Darwin's variation principle	308
54. States of negative energy in Dirac's theory	310
54.1. Solution of the Dirac equations for a free particle	310
54.2. The production and annihilation of positrons	313
54.3. Relativistic theory of the Compton effect	316

55. The relationship of Dirac's equations to previous theories	317
56. Solutions of the Dirac equations	322
56.1. Rectilinear motion of an electron	322
56.2. Energy levels of the hydrogen atom	323
56.3. Motion of an electron in a uniform magnetic field	327
56.4. The scattering of fast electrons by a nucleus	329
56.5. The polarization of electrons by double scattering	332
57. The relativistic wave equation for two electrons	336
57.1. Equations of Eddington and Breit	336
57.2. The correspondence method of Møller	338
57.3. Collisions between two fast charged particles	339
57.4. The relativistic theory of the Auger effect	342
57.5. The internal conversion of gamma-rays	345
58. The Dirac equations in spinor form	351
59. Relativistic wave equations for particles of spin greater than a half	353
CHAPTER XII: MATRIX MECHANICS	356
60. Introduction	356
61. The classical Poisson bracket	356
62. The quantum Poisson bracket	358
63. Angular momentum relations for a single electron	359
64. The angular momentum of a system of electrons	361
65. The equations of motion	362
66. Matrix mechanics	363
67. The solution of special problems	366
68. Canonical transformations	368
69. Perturbation theory in matrix mechanics	369
70. Dirac's generalization of matrix mechanics: Schrödinger's equation	372
APPENDIX: PROPERTIES OF ORTHOGONAL FUNCTIONS	375
1. Introduction	375
2. Hermite polynomials and functions	376
3. Integrals involving Hermite functions	377
4. Laguerre polynomials	379
5. The Legendre polynomials	380
6. Integral expression for the Legendre polynomial P_n	381
7. The associated Legendre polynomials	382
8. Integrals involving the associated Legendre functions	384
9. Some expansions involving Legendre functions	385
10. Surface spherical harmonics	387
