1	The soil environment	1
	Soil formation	1
	The soil-forming factors	3
	Parent material	4
	Climate	5
	Topography	8
	Time	9
	Organisms	15
	Soil properties	15
	Soil texture and structure	16
	Soil organic matter	16
	Soil water	18
	Soil pH	18
	Conclusions	19
2	The diversity of life in soil	21
	The soil biota	22
	The soil microbiome	22
	Bacteria and fungi	23
	Protists and viruses	28
	Soil fauna	29
	Microfauna	31
	Mesofauna	32
	Macrofauna	34
	Patterns of soil biodiversity	36
	Global patterns of soil biodiversity	37
	Field- and ecosystem-scale patterns of soil biodiversity	39
	A note on above-ground theory	43
	Local-scale patterns of soil biodiversity	45
	Temporal patterns of soil biodiversity	47
	Conclusions	51

3	Soil biota and ecosystem functioning	53
	Microbial control of soil nutrient availability	53
	N mineralisation	54
	N fixation	57
	Microbial P mineralisation	58
	Mycorrhizal fungi and plant nutrient supply	61
	Rhizosphere priming	64
	Trophic interactions as control points of nutrient availability	66
	Selective feeding	67
	Microbial-feeders, soil nutrient cycling, and plant growth	67
	Consumption of litter and production of faecal pellets	70
	Trophic cascades and soil functioning	71
	A note on fungal and bacterial energy channels	72
	Soil biota contributions to soil biophysical properties	74
	Functional consequences of soil biodiversity	75
	Conclusions	80
4	Feedbacks between plants and soil biota	81
	Plant species effects on soil biota	81
	Home-field advantage	86
	Trait-based frameworks	87
	Incorporating root traits	90
	A role for plant polyphenols	93
	Invasive plants and soil biota	95
	Plant diversity, soil biota, and ecosystem functioning	98
	Soil biota as regulators of plant community dynamics	100
	Mycorrhizal fungi	101
	N-fixing organisms	103
	Root pathogens	105
	Root-feeding fauna	108
	Below-ground resource partitioning	109
	Conclusions	113
5	Above-ground consumers, soil biota, and ecosystem function	115
	Mechanisms and pathways	116
	Accelerating effect	117
	Decelerating effect	122
	Herbivores and ecosystem stoichiometry	126
	Herbivore type, size, and diversity	127
	Herbivore movement and nutrient redistribution	130
	Predator control of below-ground processes	131
	Herbivores and soil C cycling	134
	Grazers and soil C storage	135
	Herbivores and C persistence in soil	138
	Conclusions	141

6	Soil biota and climate change	143
	Direct pathways	145
	Warming effects on soil biota	145
	Drought	149
	Floods, heatwaves, freezing, and fire	154
	Indirect pathways	156
	Below-ground processes and elevated CO ₂	157
	Plant community change	161
	Multiple global change factors	164
	Conclusions	166
7	Soil biota and sustainability goals	167
	Sustainable agriculture	169
	Soil tillage	169
	Crop management	171
	Soil amendments	176
	Ecosystem restoration	179
	Priority effects and plant–soil feedback	181
	Biodiversity–productivity relationships	183
	Soil transplants	185
	Climate change adaptation and mitigation	187
	Sequestration and stabilisation of soil C	188
	Afforestation	193
	Conclusions	195
8	Some conclusions and future perspectives	197
