

Contents

1 Introduction: The biochemical basis of exercise and sport

Learning objectives	1
Introduction	2
Historical perspective	3
Evolution of records	3
The appliance of science	11
The abuse of science	12
Key points	13

2 The weightlifter

Learning objectives	14
Introduction	15
Muscle structure and function	16
Types of muscle	16
Structure of skeletal muscle	16
Muscle fibre ultrastructure	18
Molecular composition of the thick and thin myofilaments	20
The contractile mechanism	21
Control of contraction	25
Motor units	27
Fibre types	29
Types of contraction	36
Eccentric exercise-induced muscle damage	36
Adaptive capacity of skeletal muscle	38
Proteins: structural and functional characteristics	39
Amino acids	39

Protein structure	44
Protein turnover	48
Anabolic hormones	50
Proteins as enzymes	51
Mechanisms of enzyme action and enzyme kinetics	51
Control of enzyme activity	57
Enzyme isoforms	58
Energy for muscle contraction	59
The role of ATP	59
Burning fuel to resynthesize ATP	62
Nutritional effects on strength training and performance	64
Protein needs	64
Supplements	66
Steroids	68
Key points	69
Selected further reading	72
 3 The sprinter	
Learning objectives	73
Introduction	74
Anaerobic metabolism	74
Phosphagen system	75
Metabolic response to very high-intensity exercise	83
ATP resynthesis from phosphocreatine breakdown	83
ATP resynthesis from glycogen metabolism	84
Phosphocreatine and glycogen breakdown in Type-I and Type-II fibres	86
Myokinase reaction	87
Loss of adenine nucleotides	88
The cellular energy charge and the adenylate pool	89
Causes of fatigue in sprinting	90
Post-exercise recovery: the resynthesis of phosphocreatine	91
Nutritional effects on sprint performance	93
Key points	95
Selected further reading	97

4 Middle-distance events	
Learning objectives	99
Introduction	100
Energy and oxygen cost of middle-distance running	101
Glycolysis	103
Fuels for glycolysis	103
The glycolytic pathway	105
Regulation of glycolysis	108
Regeneration of NAD	111
Oxidative metabolism of carbohydrate	112
Fatigue mechanisms in middle-distance events	113
Recovery after exercise	117
Nutritional effects on the performance of the middle-distance athlete	119
Carbohydrate	119
Increasing buffer capacity	121
Key points	125
Selected further reading	126
5 The endurance athlete	
Learning objectives	127
Introduction	128
Energy supply	129
Aerobic power	130
Fractional utilization of aerobic capacity	131
Energy metabolism	133
Oxidation of carbohydrate	136
Fat as a fuel	137
Fat metabolism	138
β -Oxidation of fatty acids	143
The tricarboxylic acid cycle	144
The terminal respiratory system	145
Amino acids as a fuel source for exercise	147

Integration and regulation of fuel use	148
Factors affecting key enzymes	149
Hormonal responses to exercise	151
Regulation of energy metabolism by hormones	154
Fatigue in prolonged exercise	161
The role of the brain in fatigue	163
Nutrition and endurance exercise performance	165
Carbohydrate and protein	166
Caffeine and carnitine	168
Key points	170
Selected further reading	173
6 The games player	
Learning objectives	174
Introduction	175
Activity patterns and work rate in games play	175
Metabolic responses to intermittent high-intensity exercise	178
Resynthesis of phosphocreatine	182
Why does the rate of lactate production fall with repeated sprints?	184
Fatigue in multiple-sprint sports	186
Nutritional strategies for team sports athletes	191
Energy and carbohydrate needs	191
Creatine supplements and performance of multiple sprints	193
Key points	196
Selected further reading	197
7 Sporting talent: the genetic basis of athletic capability	
Learning objectives	199
Introduction: factors determining success in sport	200
The nature of the genetic material	201
Key points	95
Selected further reading	97

Nucleic acids and control of protein synthesis	202
Mutations	214
Principles of heredity	215
Inheritance of traits	215
Muscle fibre-type composition: determined by nature or nurture?	219
Gene doping: a realistic prospect?	221
Key points	223
Selected further reading	225

8 Adaptations to training

Learning objectives	226
Introduction	227
Training strategies and the associated adaptations	229
Training for strength	231
Training for speed	235
Training for middle distance: increasing anaerobic capacity	237
Training for endurance: increasing aerobic capacity	238
Mechanisms and limitations to adaptation	242
Overreaching and overtraining	253
Exercise training, immune function, and susceptibility to infection	255
Acute effects of exercise on immune function	256
Chronic effects of exercise training on immune function	257
Effects of detraining	258
Nutritional effects on training adaptation	259
Training and diet	259
Nutrient–gene interactions	260
Free radicals and antioxidants	263
Key points	278
Selected further reading	279

Appendix 1 Key concepts in physical, organic, and biological chemistry

Introduction	283
Matter, energy, and atomic structure	283
Chemical bonds, free energy, and ATP	286
Hydrogen ion concentration and buffers	289
Membrane structure and transport	291
Cells and organelles	295

Appendix 2 Glossary of abbreviations and biochemical terminology

Abbreviations	297
Biochemical terminology	301

Appendix 3 Units commonly used in biochemistry and physiology

Système International d'Unités (SI units)	306
Derived SI units and non-SI units allowed or likely to be met	307
SI fractions and multiples	307

Index	309
-------	-----

Selected further reading	197
--------------------------	-----

Sporting talent: the genetic basis of athletic capability

Learning objectives	199
Introduction: factors determining success in sport	200
The nature of the genetic material	201
