Contents

1. Introduction and motivation 1

Introduction: A chemist's job 1

Motivation: The next NMR 2

Core chemical concepts: Chemists already understand 90% of computational chemistry 3

Overview of the text 4

References 4

SECTION I Core modules

2. Core chemical concepts 9

Introduction 9

Setting the stage: Mathematical language 9

Matter, energy, and change 10

Atoms, molecules, and reactions 12

Chemical equilibrium, rates, and catalysts 13

Quantum mechanics 13

Orbitals and orbital energies in the hydrogen molecule 16

Atomic orbitals and periodic trends 19

Light-matter interactions 21

Winning the game 22

References 22

3. Basis sets and atomic orbitals 23
Introduction 23
Basis sets: Music theory, image compression, and molecular orbitals 23
Atomic orbital basis sets: Nomenclature, common properties, and differences 25
Example 1: Exactness and expedience in the hydrogen atom 28
Example 2: Polarizability and polarization functions 31
Example 3: Diffuse functions for charged states, ionization potentials, and electron affinities 32
Example 4: Core electrons and relativistic effective core potentials 34
References 36

4. Self-consistent field molecular orbital calculations 37
Introduction 37
The mean field: Many-electron wavefunctions from one-electron orbitals 37
Self-consistent orbitals and self-fulfilling prophecies 38
Example 1: Computing an orbital energy diagram 41
Example 2: Self-consistent field convergence 43
Example 3: Electron correlation and spin symmetry breaking 45
Example 4: Symmetry breaking in transition metals 48
References 50

5. Geometry optimization 51
Introduction 51
Hypotheses, representations, and chemical structures 51
Example 1: Stable structures and geometry optimization algorithms 53
Example 2: Conformers, isomers, and local minima 56
Example 3: Geometry optimization is garbage in, garbage out 59
References 62

6. The art of interpretation I: Charge densities, electrostatic potentials, and molecular orbitals 63
Introduction 63
The ugly truth of chemical aesthetics 64
Example 1: Aesthetic choices for unambiguous densities: The hydrogen atom 64
Example 2: Electrostatic potentials 66
Example 3: Banana bonds and the aesthetics of molecular orbitals 68
References 72

7. The art of interpretation II: Partial atomic charges, oxidation states, and bond orders 75
Introduction 75
Example 1: Water's partial atomic charges 75
Example 2: Oxidation states. No ligand is innocent 78
Example 3: Bond orders in dissociating bonds and phosphine oxide 80
References 83

8. Dynamics and conformational sampling 85
Introduction 85
Two hard problems: timescales and conformational search 85
Example 1: Bond-breaking dynamics 89
Example 2: conformational search 90
Example 3: conformations of solvent 93
References 95

9. Data processing 97
Introduction 97
Example 1: Acetaldehyde atomization energy 99
Example 2: H_2 dissociation curves 103

Example 3: From individual energies to coupled equilibria 105
Reference 109

SECTION II Shared modules

10. Formation enthalpies and equilibrium constants 113
Introduction 113
The water–gas shift 113
Example 1: Zeros of energy and the formation energy of carbon monoxide 114
Example 2: RRHO corrections for energy, enthalpy, and free energy 116
Example 3: Improving accuracy with single-point corrections and composite methods 117
Example 4: Equilibrium constants 118
References 119

11. Transition states and reaction rates 121
Introduction 121
Hydrogen abstraction by chlorine: Reaction and mechanistic proposal 123
Example 1: Optimizing a transition state geometry 125
Example 2: From Gibbs free energies to predicted rates and rate constants 128
Example 3: Refining predicted barriers with single-point corrections 130
References 132

12. Model solvent 135
Introduction 135
Continuum and discrete model solvents 136
Example 1: Sodium chloride dissociation in water 137
Example 2: Hydronium and explicit solvent 138

Example 3: Explicit plus implicit solvent for solvent-catalyzed tautomerization 140
References 143

13. Electronic structure approximations: Semiempirical, ab initio, and density functional theory 145
Introduction 145
Two examples of electron correlation 146
Example 1: Atomization energies 147
Example 2: Covalent bond dissociation 151
Example 3: Noncovalent interactions 157
References 158

14. Chemical databases and machine learning 161
Introduction 161
Example 1: Using the PubChem database 163
Example 2: Descriptors and classifiers: finding patterns in chemical data 165
Example 3: Building models from data: a parameterized hybrid density functional 169
References 176

SECTION III Specific experiments

15. Ionization potentials, electron affinities, and redox potentials 181
Introduction 181
Example 1: Ionization potentials and electron affinities of gas-phase atoms 182
Example 2: Vertical and adiabatic ionization potentials and electron affinities 185

19. pH-dependent processes 239
Introduction 239
Example 1: Gas-phase pK_a 241
Part 2: pK_a in solvents 243
Part 3: pH-dependent solvent partitioning and logD 245
References 249

20. Electronic excitations and UV/vis spectroscopy 251
Introduction 251
Example 1: Singlet, triplet, and doubly excited states of beryllium atom 253
Example 2: UV/Vis absorption and fluorescence of benzene and perylene 259
Example 3: Basis sets, solvents, and the challenge of weakly bound excited states 262
References 264

SECTION IV Summary examples

21. Modeling transition metal catalysis 269
Introduction 269
The problem: A proposed mechanism for a superoxide dismutase mimic 269
Choose and check a model for the reaction in solvent 272
Choose a model catalyst and reactant 274
Write a detailed model for each reaction intermediate 276
Do the calculations and plot the results 276
Identify catalyst descriptors 279
References 281

22. Applications in drug design 283
Introduction 283
Example 1: Drug docking and scoring 284
Example 2: Modeling novel binding motifs 287
Example 3: Chameleonicity beyond the rule of five 289
References 291
