Historical foreword on the centenary after Felix Hausdorff's classic *Set Theory* — xi

Preface — xv

2 Fundamentals of the theory of functions — 1

Introduction — 1

2.1 Descriptive and prescriptive spaces — 2

2.1.1 Ensembles and their envelopes — 2

2.1.2 The four transfinite collections of extensions of an ensemble — 20

2.1.3 Classification of Borel sets for arbitrary and perfect ensembles — 31

2.1.4 Descriptive spaces with negligence — 42

2.1.5 Prescriptive spaces — 47

2.2 Families of real-valued functions on a set — 49

2.2.1 Real-valued functions and pointwise operations over them — 49

2.2.2 The pointwise order between functions — 52

2.2.3 The pointwise and uniform convergences of nets and sequences of functions — 55

2.2.4 Some useful functional families — 59

2.2.5 Zero-sets and cozero-sets of functions — 71

2.2.6 The equivalence of functions with respect to ideal ensembles — 74

2.2.7 Seminorms and norms of the uniform convergence on families and factor-families of functions — 77

2.2.8 Pointwise continuous linear functionals on lattice-ordered linear spaces of functions — 92

2.2.9 Truncatable lattice-ordered linear spaces of functions — 98

2.3 Families of measurable and distributable functions on a descriptive space — 100

2.3.1 Measurable and distributable functions — 100

2.3.2 Pointwise operations over measurable and distributable functions — 104

2.3.3 The pointwise order between measurable and distributable functions — 108

2.3.4 The pointwise and uniform convergences of sequences of measurable and distributable functions — 109

2.3.5 Separability of sets by measurable and distributable functions — 116

2.3.6 Description of normal and completely normal families and envelopes. Naturalness of the family of measurable functions — 119
2.3.7 Correlations between Baire's and Borel's functional collections — 124
2.3.8 Families of semimeasurable functions on a space with an ensemble — 134
2.4 Families of uniform functions on a prescriptive space — 140
2.4.1 Uniform functions and their properties — 140
2.4.2 Pointwise operations over uniform functions — 142
2.4.3 The uniform convergence of sequences of uniform functions — 144
2.4.4 Separability of sets by uniform functions — 146
2.4.5 Symmetrizable functions on a space with an ensemble — 150
2.4.6 Descriptions of boundedly normal families and envelopes. Naturalness of the family of uniform functions — 153
2.4.7 Fine correlations between Baire's and Borel's functional collections — 158
2.5 Families of functions on a descriptive space with negligence — 162
2.5.1 Almost measurable, almost distributable, and almost uniform functions — 162
2.5.2 Quasimeasurable, quasidistributable, and quasiuniform functions — 165

3 Fundamentals of the measure theory — 179
Introduction — 179
3.1 Spaces with semimeasures and measures — 180
3.1.1 Spaces with evaluations, semimeasures and measures — 180
3.1.2 Families of evaluations, semimeasures, and measures on a descriptive space — 185
3.1.3 The total variation of a natural evaluation — 187
3.1.4 Some extensions of additive evaluations defined on semirings and rings — 193
3.1.5 Extension of a positive measure to a wide complete saturated measure — 208
3.1.6 Properties of the extended Borel – Lebesgue measure on $\mathbb{R}^n$ — 222
3.2 Decompositions of semimeasures and measures — 226
3.2.1 The Hahn and Jordan decompositions of measures on a δ-ring — 226
3.2.2 The Riesz decomposition of overfinite semimeasures and measures on a ring — 231
3.2.3 Norms on linear spaces of bounded semimeasures and measures — 239

3.2.4 Absolute continuity and singularity and the Lebesgue decomposition — 240
3.3 The Lebesgue integral — 247
3.3.1 Measurable functions on a space with a positive wide measure — 247
3.3.2 The Lebesgue integral over a space with a positive measure — 255
3.3.3 Sequential properties of the Lebesgue integral — 263
3.3.4 Properties of density and completeness for the family and the factor-family of integrable functions — 266
3.3.5 Comparison of some Lebesgue integrals over spaces with positive wide measures — 273
3.3.6 The Lebesgue integral over a space with an arbitrary wide measure. The problem of characterization of Lebesgue integrals as linear functionals — 276
3.3.7 Wide measures defined by densities — 283
3.3.8 The Lebesgue – Radon – Nikodym theorem — 289
3.3.9 Dual to the factor-space of integrable functions — 296
3.4 Representation of a functional by the Lebesgue integral — 300
3.4.1 Regularity and continuity of evaluations. The key theorem for integral representations — 300
3.4.2 Representation of pointwise σ-continuous functionals by Lebesgue integrals. The solution of the problem of characterization of Lebesgue integrals as linear functionals — 303
3.4.3 Representation of pointwise continuous functionals by Lebesgue integrals — 311
3.5 Topological spaces with measures. The Radon integral — 316
3.5.1 Topological spaces with evaluations, semimeasures, and measures — 316
3.5.2 Measurable and integrable functions on topological spaces with measures — 323
3.5.3 Wide Radon measures on Hausdorff spaces. The problem of characterization of Radon integrals as linear functionals — 328
3.5.4 Narrow Radon measures on Hausdorff spaces — 334
3.5.5 Radon bimeasures on Hausdorff spaces — 339
3.5.6 The Radon integral over a Hausdorff space with a Radon bimeasure — 352
3.6 Representation of a functional by the Radon integral — 355
3.6.1 σ-Exact linear functionals on spaces of symmetrizable functions — 355
3.6.2 Extensions of σ-exact functionals on spaces of symmetrizable functions by the Young – Daniell method — 362

3.6.3 Characterizations of Radon integrals with respect to positive Radon measures on a Hausdorff space as linear functionals — **381**
3.6.4 The solution of the problem of characterization of Radon integrals as linear functionals — **388**
3.7 The Riemann integral — **394**
3.7.1 The Riemann integral over a topological space with a positive bounded Radon measure — **394**
3.7.2 Description of the family of Riemann integrable functions on a Tychonoff space and its consequences — **396**
3.7.3 The Riemann integral for $\mathbb{R}^n$ — **405**

D Historical notes on the Riesz – Radon – Fréchet problem of characterization of Radon integrals as linear functionals — 411
D.1 The original Riesz representation theorem — **411**
D.1.1 Functions of bounded variation — **411**
D.1.2 The Riemann – Stiltjes integral — **412**
D.1.3 The Hadamard – Fréchet problem — **412**
D.1.4 The Riesz theorem — **413**
D.1.5 Extension of positive functionals by Young's method — **413**
D.1.6 The property of norm preserving — **414**
D.1.7 Construction of the integral corresponding to a given functional — **416**
D.2 Transition from functions of bounded variation to bounded measures on compact spaces — **417**
D.3 Stage of unbounded positive measures on locally compact spaces — **418**
D.4 Stage of bounded measures on non-compact spaces. Tight functionals — **419**
D.5 Transition to unbounded measures on arbitrary Hausdorff spaces — **420**

Index of terms — 421

Index of notations — 443

Bibliography — 451
