Chapter 1 Setting the scene for mineral resource estimation 1

Introduction 1
Risk quantification and geological factors 2
Conclusion 5
References 6

Chapter 2 A brief history of mining geostatistics 7

Introduction 7
Genesis of geostatistics 7
The evolution journey of geostatistics 9
Maturity 10
Geostatistics in the digital era 12
Contemporary challenges and future directions 12
Conclusion 13
References 13

Chapter 3 Sampling for mineral resources estimation 15

Introduction 15
Problem definition 15
Relevance 16
Methods 16
Truth 17
Causality 18
The influence of time and space 20
Reduction of bias 21
Representivity 22
Accuracy, precision, and measurement resolution 23
Types of sampling 23

Actual sampling practices on a mine 25
Reverse circulation (RC) drilling 27
Rotary air drilling 28
Core drilling 28
The two methods of measuring core-bedding angle 29
Chip channel sampling 31
Theory of sampling 35
The importance of TOS and proper sampling protocols 40
Conclusion 40
References 41
Theoretical exercise for Chapter 3 42
Calculation exercise for Chapter 3 43

Chapter 4 Geological considerations in mineral resource estimation 46

Introduction 46
Techniques for assessing geological uncertainty 48
Orebody modelling 50
Understanding the data being utilised 51
Some factors to look out for on a wireframe that has been created 52
Creating the wireframe 52
Creating a geological confidence model 53
Inferences from basic assumptions 54
What do we need to do? 54
Basic assumptions on orebody continuity 54
Inferences from basic assumptions 55
So, what do you need to do? 55
Conclusion 56
References 57
Questions for Chapter 4 57

Chapter 5 Preliminary mineral resources estimation processes 59

Introduction 59
The preparation process for mineral resources estimation 60
Validate and prepare drill hole information accurately and in the correct electronic format 60
Validate and prepare any mapping information in three-dimensional space and electronic format 62
Examine sampling data daily 62
Prepare any facies interpretation 63
Review prior life-of-mine plans 63
Do a detailed examination of structural interpretations 64
Modelling process flow 65

Part 1 – Exploratory data analysis 65
Part 2 – Regularisation and support size 66
Part 3 – Declustering and nugget effect analysis 67
Part 4 – Calculate experimental variograms and associated parameters 67
Part 5 – Pre-estimation cross-validation 68
Part 6 – Local mean determination 68
Part 7 – Macro kriging considerations 69
Part 8 – Kriging choice 70
Part 9 – Economic assessment for mine planning 71
Part 10 – Model handover considerations 71
Sample types and associated uncertainties 72
The planned task observation 72
The unplanned task observation 73
The quality control and quality assurance graphs 74
The use of certified reference material and blank samples 75
Exercising due caution in determining a suspect assay 78
Outlier determination 78
Data description 80
Histograms and probability plots 81
Check for trends 83
Domains 85
Estimation of statistical domains 86
Data declustering and support size determination 87
Deriving the actual Selective Mining Unit (SMU) 90
Information effect 92
Calculation of experimental semi-variogram 92
The point semi-variogram 94
The block semi-variogram 94
Semi-variogram maps 95
Semi-variogram models 95
Kriging 101
Kriging optimisation 106
Determining the kriging regression slope 107
Determining the KRIGING EFFICIENCY 108
Case study: change of support in mineral resources estimation 109
Background 109
Data sources and scale considerations 109
Applications and analysis of volume–variance relationship 110
Limitations and uncertainties 111
Worked example 113
Modelling anisotropy 117
Importance in kriging 117
Conclusion 121
References 123

Chapter 6 Mineral resources and mineral reserves estimation process 125

Introduction 125
Linear interpolation techniques 126
Nonlinear techniques for grade and tonnage estimation 133
Purpose and approach 134
Number of samples required to obtain a representative mean 135
Calculating the representative localised mean 136
Obtaining a mean representative of a domain or zone 137
Number of samples required for a representative mean of a regularised block 137
Macro Kriging 138
Process flow Macro Kriging 138
Calculating the nugget effect for a Macro Kriging exercise 139
Macro Kriging semi-variogams and modelling 139
Summary for Macro Kriging 140
Conclusion 140
References 141

Chapter 7 Post-mineral resources estimation processes 143

Introduction 143
Considerations for mineral resources classification 144
Example of classifying Kriged estimates 148
The geological confidence 152
Obtaining the overall confidence 152
Sub-economic mining functions 153
Methods of change of support 154
Why do we need a change of support? 154
What parameters are required for doing the change of support? 155
Calculating the dispersion variances 155
Calculating the change of support at SMU 158
Calculating the actual resource available 160
Converting mineral resources to mineral reserves 162
Conclusion 162
References 163

Chapter 8 Nonlinear geostatistical methods and conversion of mineral reserves 166

Introduction 166
Sequential Gaussian simulation 167
Calculation of Recoverable Reserves 169
Converting Resources to Reserves 172
Definition of mineral reserves 174
Criteria for converting Resources to Reserves 174

Categories of mineral reserves 175
Reporting mineral reserves 175
Additional considerations 176
Special additional notes for Chapter 8: PluriGaussian simulations in geosciences 176
Background 176
Mathematical foundations 177
Process of performing PluriGaussian simulations 177
Conclusion 180
References 181
Exercise for Chapter 8 182
Exercise for PluriGaussian simulation 183

Chapter 9 Grade control in mineral resources management and mine planning 186

Introduction 186
Drivers for effective grade control 187
Workflow for grade control 188
The significance of sampling in grade control 189
Data management in grade control: ensuring data integrity 191
Localised resource estimation for grade control model 193
Processes for grade control 194
Conclusion 195
References 196
Grade control exercise questions and answers 196

Chapter 10 Mine-to-mill reconciliation for efficiency, resource utilisation, and profitability 198

Introduction 198
Steps in mine-to-mill reconciliation 198
The process for mine-to-mill reconciliation 199
Formalising the reconciliation framework 204
Challenges in mine-to-mill reconciliation 206
Conclusion 206
References 206
Exercise for Chapter 10 207

Chapter 11 Cut-off grade, net present value, and profit margin optimisation 209

Introduction 209
The mechanics of cut-off grade 210
Principles of cut-off grade determination 210
Common methods of cut-off-grade determination 213
Conclusion 221
References 221
Exercise for Chapter 11 223

Appendix 1: Log transformation 227
Appendix 2: Normal score transformation 231
Appendix 3: Q–Q plot (quantile–quantile plot) 233
Appendix 4: Nearest neighbour (NN) 235
Appendix 5: Inverse distance weighting 236
Appendix 6: Krige's relationship 238
Appendix 7: Semi-variogram 239
Appendix 8: Sampling 240
Appendix 9: Core logging 251
Appendix 10: Calculating the economic breakeven 253
Appendix 11: Hands-on practical python codes 255
Index 257
