1	Introduction	12
2	Quantification of microstructure morphology	16
2.1	Basic concepts and hypotheses	16
2.1.1	Concept of an ensemble	17
2.1.2	Ergodic hypothesis	18
2.1.3	Statistical homogeneity	18
2.1.4	Statistical isotropy	18
2.2	Microstructure description	19
2.2.1	Microstructure description for general composites	19
2.2.2	Microstructure description for particulate composites	20
2.2.3	Connection between functions S and ρ for particulate microstructures	23
2.3	Numerical evaluation of microstructural statistics	24
2.3.1	Functions S_n	25
2.3.2	Functions ρ_n	27
2.3.3	Microstructural statistics for theoretical models of microstructures	28
2.4	Analysis of real microstructure	31
2.4.1	Testing ergodic hypothesis	31
2.4.2	Test of statistical isotropy	33
2.4.3	Microstructure describing functions	33
3	Local and overall response of random composites via periodic fields	38
3.1	Construction of the periodic unit cell	38
3.1.1	Objective function and problem definition	39
3.1.2	Stochastic optimization methods	42
3.1.3	Test example	50
3.1.4	Some additional improvements	51
3.1.5	Determination of periodic unit cell	56
3.2	Effective response of composites with periodic microstructure	59
3.2.1	Effective elastic moduli	59
3.2.2	Numerical results	62
3.3	Thermal and residual fields	64
3.3.1	Thermomechanical response	64
3.3.2	Thermo-viscoelastic response	66
3.3.3	Closure	72

4	Macroscopic material properties based on extended Hashin–Shtrikman variational principles	75
4.1	Body with prescribed surface displacements and eigenstresses	76
4.2	Body with prescribed surface tractions and eigenstrains	79
4.3	Numerical examples - 1	82
4.4	Viscoelastic response	84
4.5	Numerical examples - 2	85
5	Conclusions	89
A	Properties of the operator $[\epsilon_0^* \tau - \langle \tau \rangle]$	96
B	Evaluation of microstructure-dependent quantities	99
B.1	Evaluation of $M(\tau)$ for impenetrable cylinders	99
B.2	Evaluation of matrices \mathbf{A}_{rs} and \mathbf{B}_{rs}	100
C	The Fourier transform	102
C.1	The Fourier transform	102
C.2	Discrete Fourier Transform	102
C.3	The convolution theorem	103
C.4	Fourier transform of the Dirac delta function	104
C.5	The Fourier transform of tensors ϵ_{ijkl}^* and σ_{ijkl}^*	104
