1 Symmetry everywhere

1

1.1 Introduction	1
1.2 Looking at symmetry	2
1.3 Some symmetrical objects	3
1.4 Defining symmetry	4
1.5 Symmetry in science	5
1.6 Symmetry in music	8
1.7 Symmetry in architecture	9
1.8 Summary and notation	10
1.8.1 Introducing symmetry notation	10
References 1	10
Problems 1	11

2 Geometry of crystals and molecules

13

2.1 Introduction	13
2.2 Reference axes	15
2.2.1 Crystallographic axes	17
2.3 Equation of a plane	18
2.4 Miller indices	19
2.4.1 Miller–Bravais indices	20
2.5 Zones	20
2.5.1 Weiss zone equation	21
2.5.2 Addition rule for crystal planes	22
2.6 Projection of three-dimensional features	23
2.6.1 Stereographic projection	24
2.6.2 Calculations in stereographic projections	30
2.6.3 Axial ratios and interaxial angles	35
2.7 Molecular geometry: VSEPR theory	36
2.8 Molecular geometry: experimental determination	38
2.8.1 Interatomic distances and angles	39
2.8.2 Conformational parameters	41
2.8.3 Internal coordinates	44
2.8.4 Errors and precision	46
2.9 Molecular geometry: theoretical determination	49
2.9.1 The Schrödinger equation	49
2.9.2 Atomic orbitals	50

2.9.3	Normalization	51
2.9.4	Probability distributions	52
2.9.5	Atomic <i>s</i> and <i>p</i> orbitals	53
2.9.6	Chemical species and molecular orbitals	55
2.10	Crystal packing	56

5 Space groups	149
5.1 Introduction	149
5.2 One-dimensional space groups	150
5.3 Two-dimensional space groups	150
5.3.1 Plane groups in the oblique system	152
5.3.2 Plane groups in the rectangular system	154
5.3.3 Limiting conditions on X-ray reflections	155
5.3.4 Plane groups in the square and hexagonal systems	158
5.3.5 The seventeen plane groups summarized	159
5.3.6 Comments on notation	160
5.4 Three-dimensional space groups	160
5.4.1 Triclinic space groups	160
5.4.2 Monoclinic space groups	161
5.4.3 Space groups related to point group 2	162
5.4.4 Screw axes	164
5.4.5 Space groups related to point group m : glide planes	164
5.4.6 Space groups related to point group $2/m$	166
5.4.7 Summary of the monoclinic space groups	168
5.4.8 Half-shift rule	169
5.4.9 Orthorhombic space groups	170
5.4.10 Change of origin	177
5.4.11 Standard and alternative settings of space groups	177
5.4.12 Tetragonal space groups	179
5.4.13 Space groups in the trigonal and hexagonal systems	187
5.4.14 Cubic space groups	192
5.4.15 Space groups and crystal structures	197
5.5 Matrix representation of space group symmetry operations	201
5.6 Black-white and colour symmetry	203
5.6.1 Black-white symmetry: potassium chloride	204
5.6.2 Colour symmetry	207
5.7 The international tables and other crystallographic compilations	209
5.7.1 The international tables for crystallography, Vol. A	209

8 Applications of group theory	283
8.1 Introduction	283
8.2 Structure and symmetry in molecules and ions	284
8.2.1 Application of models	284
8.2.2 Application of diffraction studies	285
8.2.3 Application of theoretical studies	287
8.2.4 Monte Carlo and molecular dynamics techniques	289
8.2.5 Symmetry adapted molecular orbitals	292
8.2.6 Transition metal compounds: crystal-field and ligand-field theories	301
8.2.7 The hexacyanoferrate(II) ion	304
8.3 Vibrational studies	307
8.3.1 Symmetry of normal modes	308
8.3.2 Boron trifluoride	309
8.3.3 Selection rules for infrared and Raman activity: dipole moment and polarizability	311
8.3.4 Harmonics and combination vibrations	315
8.4 Group theory and point groups	316
8.4.1 Cyclic point groups	317
8.4.2 Dihedral point groups	317
8.4.3 Cubic rotation point groups	318
8.4.4 Point groups from combinations of operators	319
8.5 Group theory and space groups	320
8.5.1 Triclinic and monoclinic space groups	321
8.5.2 Orthorhombic space groups	322
8.5.3 Tetragonal space groups	323
8.5.4 Cubic space groups	324
8.6 Factor groups	325
8.6.1 Factor group analysis of iron(II) sulphide	326
8.6.2 Symmetry ascent and correlation	327
8.6.3 Site group and factor group analyses	327
