TABLE OF CONTENTS

Introduction 7
1 Basic knowledge in the area of optimization methods 10
1.1 Introduction to the issue 10
1.2 An overview of basic knowledge necessary for creating linear mathematical models 19
2 Operation of selected segments of the transport networks 23
2.1 Introduction to the issue 23
2.2 Operation of the nodes of transport networks 23
2.2.1 Exact approaches – the Little's algorithm 26
2.2.2 Heuristic approaches 30
2.2.2.1 The method of the closest unvisited vertex 31
2.2.2.2 Clark-Wright method (CWM) 32
2.3 Operation of the sections of transport networks 35
2.3.1 Operation of the sections of Eulerian transport networks 36
2.3.2 Operation of the sections of non-Eulerian transport networks 37
3 The design of signal plans for light controlled intersections 42
3.1 Introduction to the issue 42
3.2 Mathematical model design 43
3.3 Preparatory steps – a procedure for determining the phase sequence 47
3.3.1 Preparatory step 1 – creating the set of phases 47
3.3.2 Preparatory step 2 – selecting the minimum number of phases 48
3.3.3 Preparatory step 3 – determining the optimal order of selected phases 49
4 Time coordination of connections 50
4.1 Introduction to the issue 50
4.2 Time coordination of connections in transit nodes 51
4.3 Time coordination of connections within common sections 56
4.3.1 The model for maximizing the minimum interval between two adjacent connections 59
4.3.2 The model for minimizing the maximum between two adjacent connections 60
4.3.3 The model for minimizing the difference between the maximum interval between two adjacent connections and the minimum interval between two adjacent connections 62
4.3.4 Other possible approaches to solving the problem 64
5 The design of the network of public transport lines 65
5.1 Introduction to the issue 65
5.2 Mathematical model for minimizing the number of vehicles under conditions of a homogeneous fleet 67
5.3 Mathematical model for maximizing the minimum relative reserve between the offered and average required number of seats within sections under conditions of a homogeneous fleet 68
5.4 Mathematical model for minimizing the number of vehicles under conditions of a non-homogeneous fleet 70
5.5 Mathematical model for maximizing the minimum relative reserve between the offered and average required number of seats within sections under conditions of a non-homogeneous fleet 72
6 Optimization of vehicle circulation 74
6.1 Introduction to the issue 74

6.2 Categorization of vehicle circulation problems 75
6.3 Task variant I – optimization of vehicle circulation under conditions of a homogeneous fleet without any possibility to change the time positions of connections 76
6.4 Task variant II – optimization of vehicle circulation under conditions of a homogeneous fleet with a possibility to change the time positions of connections 78
6.5 Task variant III – optimization of vehicle circulation under conditions of a non- homogeneous fleet without any possibility to change the time positions of connections, with a full overlap between the subsets of connections..... 79
6.6 Task variant IV – optimization of vehicle circulation under conditions of a non- homogeneous fleet without any possibility to change the time positions of connections, with disjunctive subsets of connections..... 80
6.7 Task variant V – optimization of vehicle circulation under conditions of a non- homogeneous fleet without any possibility to change the time positions of connections, with a partial overlap between the subsets of connections..... 80
6.8 Task variant VI – optimization of vehicle circulation under conditions of a non- homogeneous fleet with a possibility to change the time positions of connections, with a full overlap between the subsets of connections..... 82
6.9 Task variant VII – optimization of vehicle circulation under conditions of a non- homogeneous fleet with a possibility to change the time positions of connections, with disjunctive subsets of connections..... 82
6.10 Task variant VIII – optimization of vehicle circulation under conditions of a non- homogeneous fleet with a possibility to change the time positions of connections, with a partial overlap between the subsets of connections..... 83
6.11 A simplified approach to vehicle circulation planning 84
7 The balance of cross-border transportation outputs 90
Conclusion..... 93
List of literature..... 94
