Preface	xi
Chapter 1. Why Study Stellar Atmospheres?	1
1.1 A Historical Précis	1
1.2 The Bottom Line	15
Chapter 2. Observational Foundations	20
2.1 What Is a Stellar Atmosphere?	20
2.2 Spectroscopy	23
2.3 Spectrophotometry	29
2.4 Photometry	32
2.5 Mass, Luminosity, and Radius	46
2.6 Interpretation of Color-Magnitude Diagrams	53
Chapter 3. Radiation	61
3.1 Specific Intensity	61
3.2 Mean Intensity and Energy Density	65
3.3 Radiation Flux	72
3.4 Radiation Pressure Tensor	75
3.5 ★ Transformation Properties of $I, E, \mathbf{F}, \mathbf{P}$	78
3.6 Quantum Theory of Radiation in Vacuum	80
Chapter 4. Statistical Mechanics of Matter and Radiation	86
4.1 Thermodynamic Equilibrium	86
4.2 Boltzmann Statistics	88
4.3 Thermal Radiation	98
4.4 Quantum Statistics	103
4.5 Local Thermodynamic Equilibrium	111
Chapter 5. Absorption and Emission of Radiation	113
5.1 Absorption and Thermal Emission	114
5.2 Detailed Balance	116
5.3 Bound-Bound Absorption Probability	121
5.4 Bound-Bound Emission Probability	130
5.5 Photoionization	136
5.6 Free-Free Transitions	137
Chapter 6. Continuum Scattering	144
6.1 Thomson Scattering: Classical Analysis	145
6.2 Thomson Scattering: Quantum Mechanical Analysis	150

6.3	★ Rayleigh and Raman Scattering	153
6.4	Compton Scattering	159
6.5	Compton Scattering in the Early Universe	165
Chapter 7. Atomic and Molecular Absorption Cross Sections		171
7.1	Hydrogen and Hydrogenic Ions	171
7.2	Multi-Electron Atoms	192
7.3	Molecules	208
Chapter 8. Spectral Line Broadening		228
8.1	Natural Damping Profile	228
8.2	Doppler Broadening: Voigt Function	231
8.3	Semiclassical Impact Theory	233
8.4	Statistical Theory: Quasi-Static Approximation	241
8.5	★ Quantum Theory of Line Broadening	248
8.6	Applications	258
Chapter 9. Kinetic Equilibrium Equations		262
9.1	LTE versus Non-LTE	262
9.2	General Formulation	264
9.3	Transition Rates	267
9.4	Level Dissolution and Occupation Probabilities	278
9.5	Complete Rate Equations	282
Chapter 10. Scattering of Radiation in Spectral Lines		290
10.1	Semiclassical (Weisskopf-Woolley) Picture	291
10.2	★ Quantum Mechanical Derivation of Redistribution Functions	301
10.3	Basic Redistribution Functions	308
10.4	More Complex Redistribution Functions	321
10.5	Emission Coefficient	327
Chapter 11. Radiative Transfer Equation		334
11.1	Absorption, Emission, and Scattering Coefficients	334
11.2	Formulation	339
11.3	Moments of the Transfer Equation	347
11.4	Time-Independent, Static, Planar Atmospheres	352
11.5	Schwarzschild-Milne Equations	361
11.6	Second-Order Form of the Transfer Equation	367
11.7	Discretization	370
11.8	Probabilistic Interpretation	373
11.9	Diffusion Limit	374
Chapter 12. Direct Solution of the Transfer Equation		378
12.1	The Problem of Scattering	379
12.2	Feautrier's Method	387
12.3	Rybicki's Method	397
12.4	Formal Solution	400
12.5	Variable Eddington Factors	418

Chapter 13. Iterative Solution of the Transfer Equation	421
13.1 Accelerated Lambda Iteration: A Heuristic View	421
13.2 Iteration Methods and Convergence Properties	425
13.3 Accelerated Lambda Iteration (ALI)	434
13.4 Acceleration of Convergence	440
13.5 Astrophysical Implementation	443
Chapter 14. NLTE Two-Level and Multi-Level Atoms	448
14.1 Formulation	448
14.2 Two-Level Atom	457
14.3 Approximate Solutions	471
14.4 Equivalent-Two-Level-Atom Approach	482
14.5 Numerical Solution of the Multi-level Atom Problem	488
14.6 Physical Interpretation	505
Chapter 15. Radiative Transfer with Partial Redistribution	511
15.1 Formulation	511
15.2 Simple Heuristic Model	515
15.3 Approximate Solutions	519
15.4 Exact Solutions	524
15.5 Multi-level Atoms	533
15.6 Applications	539
Chapter 16. Structural Equations	546
16.1 Equations of Hydrodynamics	546
16.2 1D Flow	554
16.3 1D Steady Flow	555
16.4 Static Atmospheres	557
16.5 Convection	558
16.6 Stellar Interiors	565
Chapter 17. LTE Model Atmospheres	569
17.1 Gray Atmosphere	569
17.2 Equation of State	588
17.3 Non-Gray LTE Radiative-Equilibrium Models	593
17.4 Models with Convection	604
17.5 LTE Spectral Line Formation	606
17.6 Line Blanketing	620
17.7 Models with External Irradiation	627
17.8 Available Modeling Codes and Grids	631
Chapter 18. Non-LTE Model Atmospheres	633
18.1 Overview of Basic Equations	633
18.2 Complete Linearization	645
18.3 Overview of Possible Iterative Methods	660
18.4 Application of ALI and Related Methods	667
18.5 NLTE Metal Line Blanketing	676
18.6 Applications: Modeling Codes and Grids	684

Chapter 19. Extended and Expanding Atmospheres	691
19.1 Extended Atmospheres	691
19.2 Moving Atmospheres: Observer's-Frame Formulation	705
19.3 Moving Atmospheres: Comoving-Frame Formulation	713
19.4 Moving Atmospheres: Mixed-Frame Formulation	736
19.5 Sobolev Approximation	743
19.6 NLTE Line Formation	754
Chapter 20. Stellar Winds	764
20.1 Qualitative Picture	765
20.2 Thermally Driven Winds	766
20.3 Radiation-Driven Winds	772
20.4 Global Model Atmospheres	800
Appendix A. Relativistic Particles	815
A.1 Kinematics and Dynamics of Point Particles	815
A.2 Relativistic Kinetic Theory	822
Appendix B. Photons	829
B.1 Lorentz Transformation of the Photon Four-Momentum	829
B.2 Photon Distribution Function	830
B.3 Thomas Transformations	831
Glossary of Symbols	833
Bibliography	849
Index	915
