Preface	xi	3.4. The Heisenberg Uncertainty Principle	56
Acknowledgments	xv	3.4.1. Wave Packets and the Uncertainty Principle	57
Introduction	xvii	3.4.2. Average Value of the Momentum and the Energy	60
1. The Wave-Particle Duality	1	Suggestion for Further Reading	61
1.1. The Particle Model of Light	1	Basic Equations	61
1.1.1. The Photoelectric Effect	1	Summary	62
1.1.2. The Absorption and Emission of Light by Atoms	4	Questions	63
1.1.3. The Compton Effect	10	Problems	63
1.2. The Wave Model of Radiation and Matter	12	4. The Hydrogen Atom	65
1.2.1. X-ray Scattering	12	4.1. The Gross Structure of Hydrogen	65
1.2.2. Electron Waves	13	4.1.1. The Schrödinger Equation in Three Dimensions	65
Suggestions for Further Reading	15	4.1.2. The Energy Levels of Hydrogen	67
Basic Equations	15	4.1.3. The Wave Functions of Hydrogen	68
Summary	16	4.1.4. Probabilities and Average Values in Three Dimensions	71
Questions	16	4.1.5. The Intrinsic Spin of the Electron	73
Problems	17	4.2. Radiative Transitions	74
2. The Schrödinger Wave Equation	19	4.2.1. The Einstein <i>A</i> and <i>B</i> Coefficients	74
2.1. The Wave Equation	19	4.2.2. Transition Probabilities	75
2.2. Probabilities and Average Values	23	4.2.3. Selection Rules	79
2.3. The Finite Potential Well	26	4.3. The Fine Structure of Hydrogen	80
2.4. The Simple Harmonic Oscillator	30	4.3.1. The Magnetic Moment of the Electron	80
2.4.1. The Schrödinger Equation for the Oscillator	32	4.3.2. The Stern-Gerlach Experiment	83
2.5. Time Evolution of the Wave Function	33	4.3.3. The Spin of the Electron	84
Suggestion for Further Reading	36	4.3.4. The Addition of Angular Momentum	85
Basic Equations	36	4.3.5. The Fine Structure	86
Summary	37	4.3.6. The Zeeman Effect	88
Questions	37	Suggestion for Further Reading	90
Problems	38	Basic Equations	90
3. Operators and Waves	41	Summary	91
3.1. Observables, Operators, and Eigenvalues	42	Questions	92
3.2. A Closer Look at the Finite Well	45	Problems	92
3.3. Electron Scattering	49		
3.3.1. Scattering from a Potential Step	49		
3.3.2. Barrier Penetration and Tunneling	53		

5. Many-Electron Atoms	95	8. Electronic Structure of Solids	167
5.1. The Independent-Particle Model	95	8.1. Introduction	167
5.1.1. Antisymmetric Wave Functions and the Pauli Exclusion Principle	96	8.2. The Bravais Lattice	168
5.1.2. The Central-Field Approximation	97	8.3. Additional Crystal Structures	172
5.2. Shell Structure and the Periodic Table	98	8.3.1. The Diamond Structure	172
5.3. The <i>LS</i> Term Energies	100	8.3.2. The hcp Structure	172
5.4. Configurations of Two Electrons	100	8.3.3. The Sodium Chloride Structure	173
5.4.1. Configurations of Equivalent Electrons	101	8.4. The Reciprocal Lattice	174
5.4.2. Configurations of Two Nonequivalent Electrons	103	8.5. Lattice Planes	177
5.5. The Hartree-Fock Method	104	8.6. Bloch's Theorem	181
5.5.1. The Hartree-Fock Applet	105	8.7. Diffraction of Electrons by an Ideal Crystal	185
5.5.2. The Size of Atoms and the Strength of Their Interactions	108	8.8. The Bandgap	187
Suggestion for Further Reading	113	8.9. Classification of Solids	189
Basic Equations	113	8.9.1. The Band Picture	189
Summary	113	8.9.2. The Bond Picture	192
Questions	114	Suggestions for Further Reading	196
Problems	114	Basic Equations	196
		Summary	197
		Questions	198
		Problems	198
6. The Emergence of Masers and Lasers	117	9. Charge Carriers in Semiconductors	203
6.1. Radiative Transitions	117	9.1. Density of Charge Carriers in Semiconductors	203
6.2. Laser Amplification	118	9.2. Doped Crystals	206
6.3. Laser Cooling	123	9.3. A Few Simple Devices	207
6.4. Magneto-Optical Traps	123	9.3.1. The p-n Junction	208
Suggestions for Further Reading	126	9.3.2. Bipolar Transistors	210
Basic Equations	127	9.3.3. Junction Field-Effect Transistors	211
Summary	127	9.3.4. MOSFETs	212
Questions	127	Suggestions for Further Reading	212
Problems	128	Summary	213
		Questions	213
7. Statistical Physics	129	10. Semiconductor Lasers	215
7.1. The Nature of Statistical Laws	129	10.1. Motion of Electrons in a Crystal	215
7.2. An Ideal Gas	132	10.2. Band Structure of Semiconductors	217
7.3. Applications of Maxwell-Boltzmann Statistics	134	10.2.1. Conduction Bands	217
7.3.1. Maxwell Distribution of the Speeds of Gas Particles	134	10.2.2. Valence Bands	218
7.3.2. Black-Body Radiation	140	10.2.3. Optical Transitions	218
7.4. Entropy and the Laws of Thermodynamics	145	10.3. Heterostructures	220
7.4.1. The Four Laws of Thermodynamics	147	10.3.1. Properties of Heterostructures	220
7.5. A Perfect Quantum Gas	149	10.3.2. Experimental Methods	221
7.6. Bose-Einstein Condensation	153	10.3.3. Theoretical Methods	223
7.7. Free-Electron Theory of Metals	155	10.3.4. Band Engineering	224
Suggestions for Further Reading	160	10.4. Quantum Wells	225
Basic Equations	161	10.4.1. The Finite Well	226
Summary	162	10.4.2. Two-Dimensional Systems	226
Questions	163	10.4.3. Quantum Wells in Heterostructures	227
Problems	164		

10.5. Quantum Barriers	229	12.4. Field Quantization	296
10.5.1. Scattering from a Potential Step	229	Suggestions For Further Reading	298
10.5.2. T-Matrices	231	Basic Equations	298
10.5.3. Scattering from More Complex Barriers	232	Summary	300
10.6. Reflection and Transmission of Light	235	Questions	300
10.6.1. Reflection and Transmission by an Interface	236	Problems	301
10.6.2. The Fabry-Perot Laser	238	13. Particle Physics	303
10.7. Phenomenological Description of Diode Lasers	239	13.1. Leptons and Quarks	303
10.7.1. The Rate Equation	240	13.2. Conservation Laws	310
10.7.2. Well Below Threshold	242	13.2.1. Energy, Momentum, and Charge	310
10.7.3. The Laser Threshold	242	13.2.2. Lepton Number	311
10.7.4. Above Threshold	243	13.2.3. Baryon Number	312
Suggestions for Further Reading	244	13.2.4. Strangeness	314
Basic Equations	244	13.2.5. Charm, Beauty, and Truth	316
Summary	246	13.3. Spatial Symmetries	317
Questions	246	13.3.1. Angular Momentum of Composite Systems	317
Problems	247	13.3.2. Parity	318
11. Relativity I	249	13.3.3. Charge Conjugation	320
11.1. Galilean Transformations	249	13.4. Isospin and Color	322
11.2. The Relative Nature of Simultaneity	252	13.4.1. Isospin	322
11.3. Lorentz Transformation	254	13.4.2. Color	328
11.3.1. The Transformation Equations	254	13.5. Feynman Diagrams	330
11.3.2. Lorentz Contraction	257	13.5.1. Electromagnetic Interactions	331
11.3.3. Time Dilation	258	13.5.2. Weak Interactions	332
11.3.4. The Invariant Space-Time Interval	261	13.5.3. Strong Interactions	334
11.3.5. Addition of Velocities	262	13.6. The Flavor and Color $SU(3)$ Symmetries	335
11.3.6. The Doppler Effect	263	13.6.1. The $SU(3)$ Symmetry Group	336
11.4. Space-Time Diagrams	265	13.6.2. The Representations of $SU(3)$	338
11.4.1. Particle Motion	266	13.7. Gauge Invariance and the Electroweak Theory	343
11.4.2. Lorentz Transformations	269	13.8. Spontaneous Symmetry Breaking and the Discovery of the Higgs	345
11.4.3. The Light Cone	270	Suggestion for Further Reading	348
11.5. Four-Vectors	271	Basic Equations	349
Suggestions For Further Reading	275	Summary	350
Basic Equations	276	Questions	350
Summary	277	Problems	351
Questions	277	14. Nuclear Physics	353
Problems	278	14.1. Properties of Nuclei	353
12. Relativity II	281	14.1.1. Nuclear Sizes	354
12.1. Momentum and Energy	281	14.1.2. Binding Energies	357
12.2. Conservation of Energy and Momentum	284	14.1.3. The Semi-Empirical Mass Formula	359
12.3. The Dirac Theory of the Electron	288	14.2. Decay Processes	361
12.3.1. Review of the Schrödinger Theory	288	14.2.1. α -Decay	362
12.3.2. The Klein-Gordon Equation	290	14.2.2. The β -Stability Valley	363
12.3.3. The Dirac Equation	290	14.2.3. γ -Decay	365
12.3.4. Plane Wave Solutions of the Dirac Equation	293	14.2.4. Natural Radioactivity	367

14.3. The Nuclear Shell Model	368
14.3.1. Nuclear Potential Wells	368
14.3.2. Nucleon States	369
14.3.3. Magic Numbers	371
14.3.4. The Spin-Orbit Interaction	371
14.4. Excited States of Nuclei	372
Suggestions for Further Reading	376
Basic Equations	376
Summary	376
Questions	377
Problems	377

Appendices

A. Constants and Conversion Factors	381
Constants	381
Particle Masses	381
Conversion Factors	382
B. Atomic Masses	383
C. Introduction to MATLAB	389
Creating a Vector	389
Plotting Functions	390
Using Arrays in MATLAB	390
Using Functions in MATLAB	391
D. Solution of the Oscillator Equation	393
E. The Average Value of the Momentum	397
F. The Hartree-Fock Applet	399
G. Integrals that Arise in Statistical Physics	401
Reference	403
Further Reading	403

Index

405

Appendices on Web Pages of Book

Appendix AA

The Gradient and Laplacian Operators

Appendix BB

Solution of the Schrödinger Equation in Spherical Coordinates

Appendix CC

More Accurate Numerical Solutions of the Eigenvalue Problem

Appendix DD

The Angular Momentum Operators

Appendix EE

The Radial Equation for Hydrogen

Appendix FF

Transition Probabilities for z-Polarized Light

Appendix GG

Transitions with x- and y-Polarized Light

Appendix HH

Derivation of the Distribution Laws

Appendix II

Derivation of Bloch's Theorem

Appendix JJ

The Band Gap

Appendix KK

Vector Spaces and Matrices

Appendix LL

Algebraic Solution of the Oscillator
