

Statistical Inference: An Integrated Approach, Second Edition presents an account of the Bayesian and frequentist approaches to statistical inference. Now with an additional author, this second edition places a more balanced emphasis on both perspectives than the first edition.

New to the Second Edition

- New material on empirical Bayes and penalized likelihoods and their impact on regression models
- Expanded material on hypothesis testing, method of moments, bias correction, and hierarchical models
- More examples and exercises
- More comparison between the approaches, including their similarities and differences

The text thoroughly covers statistical inference without delving too deep into technical details. It compares the Bayesian and frequentist schools of thought and explores procedures that lie on the border between the two. Many examples illustrate the methods and models, and exercises are included at the end of each chapter.

Features

- Provides readers with an integrated understanding of statistical inference from both classical and Bayesian perspectives
- Describes the strengths and weaknesses of the two viewpoints, emphasizing the importance of a comparative approach to inference
- Covers all the main topics of inference, including point and interval estimation, hypothesis testing, prediction, approximation, and linear models
- Includes real data examples and numerous exercises

Contents

Preface to the Second Edition	xiii
Preface to the First Edition	xv
1 Introduction	1
1.1 Information	2
1.2 The concept of probability	3
1.3 Assessing subjective probabilities	6
1.4 An example	7
1.5 Linear algebra and probability	12
1.5.1 Probability theory	12
1.5.2 Linear algebra	15
1.6 Notation	16
1.7 Outline of the book	17
Exercises	19
2 Elements of inference	21
2.1 Common statistical models	21
2.2 Likelihood-based functions	23
2.2.1 Likelihood function	24
2.2.2 Fisher information	27
2.3 Bayes theorem	31
2.3.1 Prediction	32
2.3.2 Sequential nature of the Bayes theorem	35
2.4 Exchangeability	37
2.5 Sufficiency and exponential family	41
2.6 Parameter elimination	47
2.6.1 Bayesian approach	47
2.6.2 Classical approach	51
Exercises	55

3	Prior distribution	65
3.1	Entirely subjective specification	65
3.1.1	Aspects on elicitation of expert beliefs	68
3.2	Specification through functional forms	69
3.3	Conjugacy with the exponential family	74
3.3.1	Binomial distribution	75
3.3.2	Normal distribution with known variance	75
3.3.3	Poisson distribution	76
3.3.4	Exponential distribution	76
3.3.5	Multinomial distribution	76
3.3.6	Normal distribution with known mean and unknown variance	77
3.3.7	Normal distribution with unknown mean and variance	78
3.4	Non-informative priors	80
3.4.1	Jeffreys non-informative priors	81
3.4.2	Reference priors	87
3.5	Hierarchical priors	89
	Exercises	91
4	Estimation	99
4.1	Introduction to decision theory	99
4.1.1	Classical decision theory	101
4.1.2	Bayesian decision theory	102
4.1.3	Statistical inference as a decision problem	104
4.2	Bayesian point estimation	105
4.3	Classical point estimation	109
4.3.1	Maximum likelihood	109
4.3.2	Method of least squares	113
4.3.3	Method of moments	115
4.3.4	Empirical distribution function	118
4.4	Empirical Bayes estimation	119
4.5	Comparison of estimators	124
4.5.1	Bias	124
4.5.2	Risk	128
4.5.3	Consistency	133
4.6	Interval estimation	135
4.6.1	Bayesian approach	135
4.6.2	Classical approach	139
4.6.3	Bonferroni inequalities	142

CONTENTS	xi
4.7 Estimation in the Normal model	142
4.7.1 One sample case	142
4.7.2 Two samples case	148
Exercises	154
5 Approximating methods	163
5.1 The general problem of inference	163
5.2 Optimization techniques	164
5.2.1 Solution of the likelihood equation	166
5.2.2 The EM Algorithm	169
5.2.3 Determining likelihood intervals	174
5.3 Asymptotic theory	176
5.3.1 Towards asymptotic confidence intervals	176
5.3.2 The delta method	179
5.3.3 First order asymptotics	180
5.3.4 Higher order asymptotics	183
5.4 Other analytical approximations	185
5.4.1 Approximation by Kullback-Liebler divergence	185
5.4.2 Laplace approximation	187
5.5 Numerical integration methods	189
5.5.1 Newton-Cotes type methods	190
5.5.2 Gauss-Hermite rules	191
5.6 Simulation methods	193
5.6.1 Monte Carlo method	193
5.6.2 Monte Carlo with importance sampling	196
5.6.3 Resampling methods	199
5.6.3.1 Jackknife	200
5.6.3.2 Bootstrap	202
5.6.3.3 Weighted bootstrap	204
5.6.4 Markov chain Monte Carlo methods	205
Exercises	213
6 Hypothesis testing	221
6.1 Introduction	221
6.2 Classical hypothesis testing	222
6.2.1 Simple hypotheses	223
6.2.2 Composite hypotheses	227
6.2.3 Hypothesis testing with the Normal distribution	232
6.3 Bayesian hypothesis testing	236
6.3.1 Bayesian testing alternatives	242

6.4	Hypothesis testing and confidence intervals	246
6.5	Asymptotic tests	250
	Exercises	255
7	Prediction	263
7.1	Bayesian prediction	264
7.2	Classical prediction	268
7.3	Prediction in the Normal model	271
7.3.1	Bayesian approach	271
7.3.2	Classical approach	273
7.4	Linear prediction	274
	Exercises	277
8	Introduction to linear models	281
8.1	The linear model	281
8.2	Classical estimation of linear models	284
8.3	Bayesian estimation of linear models	290
8.4	Hierarchical linear models	297
8.5	Dynamic linear models	302
8.5.1	Definition and examples	302
8.5.2	Evolution and updating equations	305
8.5.3	Special aspects	307
8.5.4	Hyperparameter estimation	308
8.6	Linear models with constraints	309
	Exercises	314
	Sketched solutions to selected exercises	319
	List of distributions	331
	References	337
	Index	343
