

Geophysical imaging methods provide solutions to a wide range of environmental and engineering problems: protection of soil and groundwater from contamination; safe disposal of chemical and nuclear waste; geotechnical site testing for underground vaults, subways, dams, reservoirs and power plants; landslide and ground subsidence hazard detection; location of archaeological artifacts.

After an introductory chapter, this book describes each method of geophysical surveying: gravity, magnetic, seismic, self-potential, resistivity, induced polarization, electromagnetic, ground-probing radar, radioactivity, geothermal, and geophysical borehole logging. A final chapter is devoted to inversion theory and tomography. Each chapter takes the reader from the theory behind the method, through data acquisition and on to interpretation, and is supported by a large number of richly illustrated case histories. The book contains many topics not included in current texts on geophysical exploration. These include microgravimetry, shallow reflection seismic profiling, the generalized reciprocal method (GRM) of interpretation, nuclear magnetic resonance (NMR) and radio-imaging, radon emanometry, cross-hole tomography, and special techniques for fracture and fluid flow detection. There are copious references for those wishing to delve deeper into particular subject areas.

This is an ideal textbook for senior undergraduate and postgraduate courses in environmental and applied geophysics, and a supplementary course-book for students of geology, engineering geophysics, civil and mining engineering. It is also a valuable reference work for professional earth scientists, engineers and town planners.

Contents

<i>Preface</i>	xxi
<i>Acknowledgments</i>	xxiii
Chapter 1 Introductory observations	1
1.1 Geophysics and the earth's environment	1
1.2 Geophysical techniques for near-surface studies	2
1.3 Environmental problems amenable to solution by geophysical means	3
1.4 Engineering geophysical investigations: targets and techniques	4
1.5 Units used in this book	4
1.6 Geological time-scale	7
References	10
Chapter 2 Gravity surveying	11
2.1 Introduction	11
2.2 Characteristics of potential fields	12
2.2.1 Gravitational force, potential, and field	12
2.2.2 Laplace's equation and Poisson's theorem	14
2.3 Rock densities	15
2.4 Acquisition and correction of gravity data	16
2.4.1 Gravity measuring instruments	16

2.4.2	Survey procedures	21
	Location and spacing of stations; positions and elevations of stations; gravity gradient survey	
2.4.3	Corrections to gravity data	22
2.4.4	Free-air and Bouguer anomalies	25
2.4.5	<i>In-situ</i> determination of density	26
2.5	Analysis and interpretation of gravity data	28
2.5.1	General considerations	28
2.5.2	Ambiguity in gravity interpretation	28
2.5.3	Isolation of anomalies: regionals and residuals	29
2.5.4	Enhancement of anomalies	31
	Digital filtering; wavelength filters; continuation filters; derivative filters	
2.5.5	Estimates of depth and anomalous mass	36
2.5.6	Methodology of interpretation	39
	General approach; forward modeling; inverse modeling	
2.6	Applications to environmental and engineering studies	43
2.6.1	Delineation of structural trends, contacts, and faults	43
2.6.2	Mapping of salt structures	45
2.6.3	Estimating shape and depth of plutons	47
2.6.4	Mapping of alluvium/bedrock contact	48
2.6.5	Gravity investigations of landfill	52
2.6.6	Microgravity studies of rockbursts in mines	54
2.6.7	Microgravity detection of subsurface voids and cavities	56
	References	61
Chapter 3	Magnetic surveying	65
3.1	Introduction	65
3.2	Physical basis of magnetic surveys	65
3.2.1	Magnetic quantities and units	65
	Magnetic potential and field; intensity of magnetization and moment	
3.2.2	Dipole field and the geomagnetic anomaly	68
3.3	Magnetic properties of rocks and soils	71
3.3.1	Induced magnetization and susceptibility	71
3.3.2	Remanent magnetization	73
3.3.3	Total magnetization and effective susceptibility	74
3.3.4	Magnetic effects of soils and iron objects	75

3.4	Acquisition of magnetic data	75
3.4.1	Magnetic survey instruments	75
3.4.2	Survey procedures and data correction	79
3.5	Data enhancement techniques	83
3.5.1	Derivatives and continuation filters	83
3.5.2	Reduction-to-pole and pseudogravity transformation	84
3.5.3	Analytic signal of magnetic anomaly field	86
3.6	Approximate methods of interpretation	86
3.6.1	Estimation of depth	86
3.6.2	Estimates of direction of magnetization and source boundaries	89
3.7	Quantitative interpretation of magnetic data	92
3.7.1	Forward modeling	92
3.7.2	Inversion of magnetic data	94
3.8	Environmental and engineering applications	94
3.8.1	Mapping of structural trends and basement features	94
3.8.2	Magnetic investigations over landfills	96
3.8.3	Detection of buried metal drums and casings	100
3.8.4	Mapping of cavities and voids	101
3.8.5	Mapping of dikes blocking groundwater flow	105
3.8.6	Detection of archaeological objects	105
	References	108
Chapter 4	Seismic surveys	112
4.1	Introduction	112
4.2	Elastic waves and propagation parameters	113
4.2.1	Body and surface waves	113
4.2.2	Pulse frequency, and attenuation characteristics	116
4.2.3	Reflection, refraction, and diffraction of waves	117
4.3	Seismic velocities in rocks	119
4.3.1	Factors affecting velocity	120
4.3.2	Velocity-density and velocity-porosity relationships	120
4.3.3	Velocity data	122
4.4	Reflection surveying	123
4.4.1	Introduction	123

4.4.2	Data acquisition in shallow seismics Seismic sources; geophones and arrays; seismographs and filters; field parameters	124
4.4.3	Reflection geometry and the concept of NMO Horizontal reflectors; dipping reflector	130
4.4.4	Common-depth point (CDP) technique	134
4.4.5	Static and dynamic corrections Static corrections; dynamic or NMO corrections	135
4.4.6	Determination of average velocities T^2-x^2 method; velocity-spectrum method; well-shooting and CVL methods	137
4.4.7	Synthesis of reflection traces	139
4.4.8	Processing of reflection data	140
4.4.9	Migration of reflection points	142
4.4.10	Shallow reflection profiling: CDP and COF techniques Optimum offset technique	143
4.4.11	Resolution limits in reflection mapping	148
4.4.12	Applications to environmental and engineering problems Mapping of fracture zones; reflection profiling in groundwater studies; delineation of bedrock valleys; detection of shallow faults and cavities	149
4.5	Refraction surveying	158
4.5.1	Introduction	158
4.5.2	Mapping of horizontal interfaces: intercept time method	158
4.5.3	Horizontal versus vertical velocity changes	161
4.5.4	Mapping of faults and steep contacts	162
4.5.5	Mapping of dipping interfaces	164
4.5.6	Mapping irregular (non-planar) interfaces	166
4.5.7	Interpretation by generalized reciprocal method	170
4.5.8	Refraction survey data acquisition	173
4.5.9	Applicability and limitations of the refraction method	173
4.5.10	Environmental and engineering applications Velocity as a guide to rock strength; detection of potential collapse features; mapping of buried ancient ditch; mapping of gravel and sand deposits; dam site investigations	175
	References	186
Chapter 5 Self-potential surveying		190
5.1	Introduction	190

5.2	Origin of self-potentials	190
	Electrofiltration; thermoelectric; electrochemical; mineralization	
5.3	Data acquisition and noise suppression	193
5.3.1	Field procedure	193
5.3.2	Noise suppression and data enhancement	194
5.4	Interpretation of SP data	196
5.5	Applications to environmental and engineering problems	199
5.5.1	Seepage flow in a landslide body	199
5.5.2	Seepage flow in dams and reservoir floors	201
5.5.3	Delineation of groundwater flow	201
5.5.4	Studies of geothermal fluid flow	203
	References	205
Chapter 6	Resistivity and induced polarization surveys	207
6.1	Introduction	207
6.2	Electrical resistivity of earth materials	208
6.3	Theory of current flow in the ground	209
6.3.1	Potential distribution in homogeneous ground	209
6.3.2	Apparent resistivity and electrode configurations	212
6.3.3	Potential and current distribution across a boundary	214
6.3.4	Computation of apparent resistivity by linear filters	218
6.4	Field procedures and selection of electrode array	220
6.4.1	Electric sounding and profiling procedures	220
	Vertical electric sounding; electric profiling	
6.4.2	Selecting an array for a particular application	224
6.5	Resistivity instruments and electrode layouts	226
6.6	Interpretation of resistivity data	228
6.6.1	General	228
6.6.2	Interpretation by master curves and auxiliary graphs	229
6.6.3	Forward and inverse modeling techniques	231
6.6.4	Ambiguity in interpretation of sounding curves	232
6.6.5	Interpretation of lateral resistivity contrasts	233
6.6.6	Interpretation of combined electric profiling and sounding	235
6.7	Applications of resistivity surveys	237

6.7.1	Groundwater exploration and water quality Delineation of aquifer boundaries in sedimentary layers; groundwater in fissured rocks; mapping boundaries of saline groundwater	237
6.7.2	Examples of environmental and engineering applications Mapping of chemical pollution plumes; delineation of water-saturated zones in landslide bodies; location of permafrost zones; location of archaeological objects; location of cavities and voids	242
6.7.3	Resistivity characteristics of geothermal fluids	249
6.8	Induced polarization method	252
6.8.1	Principles	252
6.8.2	Time-domain and frequency-domain measurements	254
6.8.3	Data acquisition Equipment; field procedures	254
6.8.4	Interpretation of IP data	256
6.8.5	Examples of applications to environmental studies Evaluation of aquifer potential; investigation of domestic waste dump; mapping of industrial contamination	257
	References	261
Chapter 7	Electromagnetic surveys	265
7.1	Introduction	265
7.2	Theory of propagation of EM fields	266
7.2.1	Fundamental quantities and field equations	266
7.2.2	Attenuation of EM fields, and depth penetration	268
7.2.3	Phase relations and elliptic polarization of EM fields	270
7.3	Classification of EM methods	272
7.4	Continuous wave field methods (frequency-domain EM)	273
7.4.1	VLF and VLF-R methods Conventional VLF; VLF-resistivity method	273
7.4.2	Horizontal loop (Slingram) method	277
7.4.3	Ground conductivity meters	280
7.4.4	Examples of applications to environmental problems Delineation of contamination plume from waste dumps; mapping industrial groundwater contamination; mapping soil salinity in farmland	282
7.5	Transient-field methods (time-domain EM)	286
7.5.1	Principles and operational designs	286

7.5.2	Interpretation of TDEM data	288
7.5.3	Examples of environmental studies	288
	Mapping of contamination plume at a landfill site; mapping of brine pockets at a waste repository site	
7.5.4	Nuclear magnetic resonance (NMR) method	292
7.6	Interpretation of EM data	293
7.6.1	Use of interpretational aids	293
7.6.2	Ambiguity in EM interpretation	296
7.7	Magnetotelluric methods	296
7.7.1	Principles of MT sounding	297
7.7.2	AMT and CSAMT methods	298
7.7.3	Inversion of AMT data	298
7.7.4	Examples of AMT surveys	300
	Mapping of permafrost zones; AMT investigations in geothermal areas	300
7.8	Radio imaging method (RIM)	302
7.8.1	Principles and practices	302
7.8.2	Example of imaging a fault zone	304
	References	306
Chapter 8	Ground-probing radar	309
8.1	Introduction	309
8.2	Basic principles	310
8.2.1	Radar propagation parameters	310
8.2.2	Range and resolution	311
8.3	Data acquisition and processing	313
8.4	Determination of radar velocities	314
8.5	Examples of environmental and engineering applications	316
8.5.1	Detection of fracture zones	316
8.5.2	Delineation of subsurface oil contamination	318
8.5.3	Mapping of geological contacts in frozen ground	320
8.5.4	Location of sinkholes and cavities	321
8.5.5	Detection of anomalous seepage	322
8.5.6	Mapping of archaeological remnants	323
8.5.7	Non-destructive testing of rock quality and structural integrity	325
	References	328

Chapter 9 Radioactivity surveys	330
9.1 Introduction	330
9.2 Fundamentals of radioactive disintegration	331
9.3 Units of radiation and dosage	332
9.4 Radioactive decay series and equilibrium	333
9.5 Radioactivity of rocks	334
9.6 Instruments for measuring radioactivity	335
9.6.1 Geiger counter and scintillometer	335
9.6.2 Gamma-ray spectrometer	336
9.6.3 Radon emanometers	337
9.7 Field procedure and operational considerations	337
9.8 Environmental concerns about radon	338
9.8.1 Generation of radon	338
9.8.2 Radon transport mechanisms	339
9.8.3 Radon-risk index	340
9.9 Examples of environmental radioactivity surveys	340
9.9.1 Assessment of indoor radon risk and groundwater contamination	341
9.9.2 Radiation from industrial and domestic waste pumps	343
9.9.3 Chernobyl radioactive fallout	345
9.9.4 Detection of faults and fracture zones	347
9.9.5 Radon-monitoring applied to earthquake prediction	347
9.9.6 Investigations of landslide development	348
9.9.7 Monitoring of radioactive contamination migration in subsurface	349
References	350
Chapter 10 Geothermal surveying	352
10.1 Introduction	352
10.2 Thermal properties of rocks	353
10.3 Propagation of thermal effects in the underground region	353
10.3.1 Depth penetration of surface temperature variations	353
10.3.2 Temperature distribution in the frozen ground	356

10.4	Conductive heat flow and thermal gradient	357
10.4.1	Heat-flow measurements	357
10.4.2	Factors affecting thermal gradient	358
10.5	Heat production in crustal rocks	360
10.6	Temperature rise due to radioactive disposal in subsurface	361
10.7	Shallow thermal investigation methods	365
10.7.1	Shallow temperature surveys	365
10.7.2	Snow-melt photography and infrared imagery	366
10.8	Examples of shallow thermal surveys	366
10.8.1	Mapping of fissures and cracks	366
10.8.2	Location of leakage in pipelines	367
10.8.3	Thermal anomalies over salt and granite bodies	368
10.8.4	Temperature anomalies over waste dumps	370
10.8.5	Thermal detection of zones of weakness and leakage in dams	370
	References	372
Chapter 11	Geophysical borehole logging	375
11.1	Introduction	375
11.2	General aspects of logging systems	376
11.3	Conventional borehole logging techniques in environmental investigations	376
11.3.1	Caliper logs	377
11.3.2	Electrical logs	377
11.3.3	Radiometric logs	380
11.3.4	Acoustic logs	384
11.3.5	Temperature logs	386
11.4	Specialized techniques for micrologging and fluid flow detection	388
11.4.1	The Ellog auger method	388
11.4.2	Microresistivity logging	389
11.4.3	Borehole televiewer log	391
11.4.4	Full waveform acoustic logging (FWAL)	392
11.4.5	Chemical/Radioactive tracer logs	393
11.5	Cross-borehole tomography for fracture and fluid flow detection	395
	References	398

Chapter 12 Inversion theory and tomography	400
12.1 Introduction	400
12.2 The inverse problem and its formulation	400
12.3 Linear inverse problems and methods of solution	402
12.3.1 The Fourier method of linear inversion	402
12.3.2 The matrix method applied to linear problems	404
Inverse calculations of density or magnetization; residual statics estimation	
12.4 Non-linear problems and methods of solution	407
12.4.1 Linearization of the non-linear problem	407
12.4.2 Unconstrained and constrained iterative solutions	408
12.5 Sample applications to non-linear problems	409
12.5.1 Inversion of gravity and magnetic data	409
2-D interpretation; 3-D interpretation	
12.5.2 Inversion of vertical electric sounding data	415
1-D, using partial derivatives; 1-D, using Zohdy's technique; 2-D interpretation	
12.5.3 Inversion of electromagnetic data	419
1-D methods; 2-D methods	
12.6 Introduction to tomography	425
12.6.1 The basic concept of tomography	425
12.6.2 Tomography in exploration geophysics	427
12.6.3 Radon transform	428
12.7 Discretization methods in tomography	430
12.7.1 Generalized matrix method	431
12.7.2 Algebraic reconstruction technique (ART)	433
12.7.3 Simultaneous iterative reconstruction technique (SIRT)	436
12.8 Transform methods of image reconstruction	436
12.8.1 Fourier projection method	437
12.8.2 Filtered back-projection (FBP) method	439
12.8.3 Wave diffraction method	439
12.8.4 EM diffraction tomography	444
12.9 Electrical resistance tomography (ERT)	445
References	448

Appendix A	Analytical continuation of potential fields	452
Appendix B	Gravity and magnetic attraction of finite vertical or horizontal cylinder	455
Appendix C	Magnetic anomaly of a right rectangular prism with an arbitrary direction of magnetization vector	458
Appendix D	Fourier series, transforms, and convolution	462
Appendix E	Poynting vector resistivity and the Bostick inversion	466
