

Contents

1	Introduction	1
2	Aims	3
3	Optimization theory	4
3.1	Local search	5
3.2	Metaheuristics	6
3.2.1	Simulated annealing	7
3.2.2	Tabu search	8
3.2.3	Evolutionary Algorithms	8
3.2.4	Other metaheuristics	11
3.3	Modeling and Simulation	12
3.4	Multi-objective Optimization	14
3.5	Optimization in transport	16
4	Integrated optimization of public transport	18
4.1	Literature review	20
4.1.1	Timetabling	20
4.1.2	Vehicle scheduling	21
4.1.3	Integrated approaches	22
4.2	Optimization problem definition	23
4.2.1	The timetabling problem for periodic timetables	24
4.2.2	The vehicle scheduling problem	25
4.3	Solution Methodology	27
4.3.1	The evolutionary algorithm NSGA-II	29
4.3.2	Random mutation	31
4.3.3	Single variable local search with aggregated objective function	32
4.3.4	Line local search with a single objective	34
4.3.5	Constant schedule cost local search with a single objective	35
4.3.6	Coordination of the components	35

CONTENTS

4.3.7	Evaluation of the Vehicle Scheduling Problem	37
4.4	Data	38
4.4.1	Small instances	38
4.4.2	Medium-sized instance	38
4.4.3	Large instance	40
4.4.4	Summary	41
4.5	Computational results	41
4.5.1	Quality indicators	42
4.5.2	Computational results	44
4.5.3	Comparison with the sequential approach and original timeta- bles	49
5	Optimization of ready mixed concrete transport	55
5.1	Previous research	56
5.2	RMC delivery process	57
5.2.1	RMC production	58
5.2.2	Transportation	58
5.2.3	Unloading of RMC	59
5.3	Model description and methodology	60
5.3.1	Hierarchical blocks	62
5.4	Computational results	64
5.4.1	Verification and validation of the model	65
5.4.2	Simulation results for different dispatching policies	65
6	Benefits of the monograph	72
7	Conclusions	74
