

Table of contents

Acronyms and abbreviations	9
Glossary	11
Executive summary	17
Chapter 1. Introducing high-value, privacy-protective health information systems	19
Data are essential to improving health care and health system performance	21
References	27
Chapter 2. High-value health data supporting health care management, policy and innovation	29
Key national health and health care datasets	32
Progress in national dataset availability since 2011	35
Highest coverage of the target population in the key datasets of Denmark, Finland, Sweden and Iceland	36
Automatic extraction of electronic data is prevalent in 13 countries	37
Twelve countries reported consistently coding health care data using a terminology standard	37
Retention periods for personal health data	38
Concerns with the quality of the data	39
Six countries use all of their national health care datasets to regularly report about the quality and performance of health care	40
Finland, Iceland, Singapore, Sweden, the United Kingdom (Scotland and Wales) have the highest proportion of key national health datasets sharing the same unique patient ID number	40
Finland, Iceland, the United Kingdom (England) and Singapore are regularly linking most of their national health care datasets for statistics and research	41
Little change in data linkage activities since 2011	43
National projects advancing high-value data to promote health and improve health care	44
Key international projects to improve health care outcomes, safety and performance	56
Key features of high-value, privacy-protective health information systems	60
Notes	61
References	62
Chapter 3. The legislative framework governing personal health data	65
Data accessibility across OECD countries	66
Legislative frameworks for the protection of privacy	68
Personal health data can have inconsistent legislative protection	72
National health datasets contain sensitive personal information	73
Legislation may permit the secondary analysis of personal health data in cases where patient consent is not possible or practicable	75
Protection of the privacy of health care providers	77
Consent to uses of data in the future that cannot be specified today	78

Data sharing for the purpose of research or statistics	81
Sharing and access to de-identified data	84
Foreign applicants for access to data	87
Data sharing challenges among national health dataset custodians	90
Legislative reforms that are needed or are underway	95
Key elements of legislative frameworks supporting privacy-protective uses of health data ...	97
References	99
Chapter 4. Open and transparent health information systems	101
Open government health data	103
Aims of open health data initiatives vary	104
Transparency about national health datasets	106
Sharing information with the public about approved studies involving personal health data processing	107
Transparency about researcher access to data	107
Public opinion about data uses	110
Public communication: Lesson's learned from the UK Health and Social Care Information Centre	111
Approaches to engaging with stakeholders and the public about the processing of personal health data	114
Key elements of data governance that promote openness and transparency	114
References	116
Chapter 5. Concentrating and strengthening national health data processing	119
Concentration of national health datasets	120
Data linkages are concentrated in many countries	120
Data processing centres	122
Accreditation or certification of data processors	123
Processing data access requests and recovering their costs	127
Strategies and techniques to improve timeliness and reduce costs	131
Accreditation or certification of data processors promotes both data security and access to data	132
References	134
Chapter 6. Fair and transparent health project approval processes	135
Project approval processes	136
Research ethics committees	137
Approval by the Data Protection Regulator following input from research ethics boards ...	139
Independent advisors within internal committees or governing boards	139
Internal decision-making process with advice from the privacy regulator	140
Internal decision-making processes	141
Appeals process	142
Transparent processes for requests to process or access personal health data	142
Project review boards must evaluate the risks and benefits to society of a proposed use of personal health data	143
Transparent and fair project approval processes are needed	145
References	146
Chapter 7. De-identifying personal health data	147
Gap between legal requirements and data de-identification in practice	149
Data are de-identified prior to analysis?	150

The use of pseudonyms to replace direct identifiers	151
Evaluating and addressing data re-identification risk	152
Weighing data de-identification techniques against dataset utility for the intended purpose	155
Data de-identification practices that consider the “big picture”: data protection, security and utility	157
References	159
Chapter 8. Health data security and management practices	161
Guidelines and policies to protect data privacy and security	164
Data security within data custodians	166
External data processors and cloud computing services	169
Protecting data during the transfer process	169
Data sharing agreements or contracts	170
Mechanisms to assure compliance with data sharing agreements	172
Penalties for non-compliance with the law and data sharing agreements or contracts	173
Data breach experiences	174
Alternatives to transferring data to third parties	175
Data security practices are essential to meeting legal requirements and public expectations ...	178
References	179
Chapter 9. The way forward for privacy-protective health information systems	181
Progress during the past five years	183
Outlook for the next five years	184
Policy and technical obstacles to progress over the next five years	185
Governance mechanisms supporting privacy-protective monitoring and research involving personal health data	186
Next steps	187
Note	189

Tables

Table 2.1. Key national health dataset availability, maturity and use	31
Table 2.2. Dataset is available at the national level	35
Table 2.3. Proportion of the population covered by the data	36
Table 2.4. Number of countries reporting sources of variables within national datasets	37
Table 2.5. Number of countries reporting coding clinical terminology	38
Table 2.6. Just over half of countries with national datasets are regularly linking the data to monitor quality or health system performance	42
Table 2.7. Thirteen countries are linking data across the pathway of care	42
Table 2.8. Seven countries are linking seven or more key datasets on a regular basis for statistics or research	43
Table 2.9. Number of countries ¹ reporting a data linkage project is taking place on a regular basis involving national datasets in 2011 and 2013	44

Table 3.1. Proportion of key national personal health datasets meeting six data accessibility factors	68
Table 3.2. Countries reporting a national law or regulation that speaks to the protection of health information privacy and/or to the protection and use of electronic clinical records	71
Table 3.3. Variables considered as being among the most sensitive within national health datasets	74
Table 3.4. Number of custodians of national datasets	81
Table 4.1. Open government health data initiatives	104
Table 5.1. Proportion of national datasets in the custody of and linked by the same organisation	121
Table 5.2. Number of organisations and datasets involved in linkage of key national health datasets	121
Table 6.1. Public communication regarding requests for access to and processing of personal health data	143
Table 6.2. Risk-benefit evaluation tool supporting decision making about the processing of personal health data	144
Table 7.1. Proportion of key national health datasets with five data de-identification practices.....	150
Table 8.1. Percentage of key national datasets where data security practices to protect data from re-identification were identified	163
Table 9.1. Views about progress in and the future of health data use	184
Table A.1. Members of the Advisory Panel of Experts on Health Information Infrastructure	192
Table B.1. Countries that responded to the 2013-14 HCQI Information Infrastructure Questionnaire.....	194
Table C.1. Participants to the 2013-14 HCQI Expert Interviews on Health Information Infrastructure	196

Figures

Figure 1.1. Data use decisions should be taken by weighing societal benefits and risks within a data governance framework that maximises benefits and minimises risks	25
Figure 2.1. Key health data availability, maturity and use	31
