PART I FUNDAMENTALS

1	General Introduction	3
1.1	Overview	3
1.2	Conceptual foundation and brief history of the latent class model	4
1.2.1	LCA and other latent variable models	6
1.2.2	Some historical milestones in LCA	7
1.2.3	LCA as a person-oriented approach	8
1.3	Why select a categorical latent variable approach?	8
1.4	Scope of this book	9
1.5	Empirical example of LCA: Adolescent delinquency	10
1.6	Empirical example of LTA: Adolescent delinquency	14
1.7	About this book	17
		vii

1.7.1	Using this book	19
1.8	The examples in this book	19
1.8.1	Empirical data sets	20
1.9	Software	21
1.10	Additional resources: The book's web site	21
1.11	Suggested supplemental readings	22
1.12	Points to remember	22
1.13	What's next	22
2	The latent class model	23
2.1	Overview	23
2.2	Empirical example: Pubertal development	24
2.2.1	An initial look at the data	24
2.2.2	Why conduct LCA on the pubertal development data?	27
2.2.3	Latent classes in the pubertal development data	28
2.3	The role of item-response probabilities in interpreting latent classes	29
2.3.1	A hypothetical example	29
2.3.2	Interpreting the item-response probabilities to label the latent classes in the pubertal development example	30
2.3.3	Qualitative and quantitative differences among the pubertal development latent classes	34
2.4	Empirical example: Health risk behaviors	34
2.4.1	An initial look at the data	34
2.4.2	LCA of the health risk behavior data	35
2.5	LCA: Model and notation	39
2.5.1	Fundamental expressions	41
2.5.2	The local independence assumption	44
2.6	Suggested supplemental readings	46
2.7	Points to remember	47
2.8	What's next	47
3	The relation between the latent variable and its indicators	49
3.1	Overview	49
3.2	The latent class measurement model	50
3.2.1	Parallels with factor analysis	50
3.2.2	Two criteria for evaluating item-response probabilities for a single variable	50

3.2.3	Hypothetical and empirical examples of independence and weak relations	53
3.2.4	Hypothetical and empirical examples of strong relations	55
3.3	Homogeneity and latent class separation	56
3.3.1	Homogeneity	56
3.3.2	Latent class separation	57
3.3.3	Hypothetical examples of homogeneity and latent class separation	58
3.3.4	How homogeneity and latent class separation are related	64
3.3.5	Homogeneity, latent class separation, and the number of response patterns observed	64
3.3.6	Homogeneity and latent class separation in empirical examples	65
3.4	The precision with which the observed variables measure the latent variable	67
3.4.1	Why posterior probabilities of latent class membership are of interest	67
3.4.2	Bayes' theorem	68
3.4.3	What homogeneity and latent class separation imply about posterior probabilities and classification uncertainty	69
3.4.4	Posterior classification uncertainty even with a high degree of homogeneity and latent class separation	72
3.5	Expressing the degree of uncertainty: Mean posterior probabilities and entropy	73
3.6	Points to remember	75
3.7	What's next	76
4	Parameter estimation and model selection	77
4.1	Overview	77
4.2	Maximum Likelihood estimation	78
4.2.1	Estimating model parameters	78
4.2.2	Options for treatment of individual parameters: Parameter restrictions	79
4.2.3	Missing data and estimation	80
4.3	Model fit and model selection	81
4.3.1	Absolute model fit	82

4.3.2	The likelihood-ratio statistic G^2 and its degrees of freedom	83
4.3.3	Relative model fit	86
4.3.4	Cross-validation	88
4.4	Finding the ML solution	89
4.4.1	Overview of model identification issues	89
4.4.2	Visualizing identification, underidentification, and unidentification	89
4.4.3	Identification and information	92
4.4.4	How to find the ML solution	92
4.4.5	Label switching	94
4.4.6	User-provided starting values	94
4.5	Empirical example of using many starting values	95
4.6	Empirical examples of selecting the number of latent classes	97
4.6.1	Positive health behaviors	97
4.6.2	Past-year delinquency	98
4.6.3	Female pubertal development	99
4.6.4	Health risk behaviors	100
4.7	More about parameter restrictions	102
4.7.1	Reasons for using parameter restrictions	102
4.7.2	Parameter restrictions and model fit	103
4.7.3	Using parameter restrictions to achieve positive degrees of freedom	103
4.8	Standard errors	106
4.9	Suggested supplemental readings	108
4.10	Points to remember	108
4.11	What's next	110

PART II ADVANCED LCA

5	Multiple-group LCA	113
5.1	Overview	113
5.2	Introduction	114
5.3	Multiple-group LCA: Model and notation	114
5.4	Computing the number of parameters estimated	116
5.5	Expressing group differences in the LCA model	116
5.6	Measurement invariance	117
5.7	Establishing whether the number of latent classes is identical across groups	119

5.7.1	Empirical example: Adolescent delinquency	120
5.8	Establishing invariance of item-response probabilities across groups	121
5.8.1	Specifying parameter restrictions	122
5.8.2	Test of measurement invariance in the delinquency example	125
5.9	Interpretation when measurement invariance does not hold	126
5.10	Strategies when measurement invariance does not hold	129
5.10.1	Partial measurement invariance	129
5.10.2	When measurement invariance holds in a subset of groups	131
5.11	Significant differences and important differences	131
5.11.1	Empirical example: Positive health behaviors	133
5.12	Testing equivalence of latent class prevalences across groups	139
5.12.1	Empirical example: Adolescent delinquency	140
5.12.2	Empirical example: Health risk behaviors	141
5.13	Suggested supplemental readings	147
5.14	Points to remember	147
5.15	What's next	148
6	LCA with Covariates	149
6.1	Overview	149
6.2	Empirical example: Positive health behaviors	150
6.3	Preparing to conduct LCA with covariates	151
6.3.1	Preparing variables for use as covariates	151
6.4	LCA with covariates: Model and notation	153
6.4.1	What is estimated	154
6.4.2	Treatment of item-response probabilities in LCA with covariates	154
6.5	Hypothesis testing in LCA with covariates	154
6.6	Interpretation of the intercepts and regression coefficients	155
6.6.1	Understanding odds and odds ratios	155
6.6.2	The correspondence between regression coefficients and odds/odds ratios	157
6.7	Empirical examples of LCA with a single covariate	159
6.7.1	Results of logistic regression using gender as a covariate	159
6.7.2	Results of logistic regression using maternal education as a covariate	161

6.8	Empirical example of multiple covariates and interaction terms	163
6.8.1	Interpretation of the interaction between gender and maternal education	165
6.9	Multiple-group LCA with covariates: Model and notation	166
6.9.1	Empirical example: Positive health behaviors	167
6.10	Grouping variable or covariate?	167
6.10.1	How the multiple-group and covariate models are different	168
6.10.2	When the multiple-group and covariate models are mathematically equivalent	169
6.11	Use of a Bayesian prior to stabilize estimation	171
6.12	Binomial logistic regression	172
6.12.1	Empirical example: Positive health behaviors	173
6.12.2	Comparison of binomial multiple groups and covariate models	176
6.13	Suggested supplemental readings	176
6.14	Points to remember	176
6.15	What's next	177

PART III LATENT CLASS MODELS FOR LONGITUDINAL DATA

7	RMLCA and LTA	181
7.1	Overview	181
7.2	RMLCA	182
7.2.1	Adding a grouping variable	185
7.2.2	RMLCA and growth mixture modeling	186
7.3	LTA	187
7.3.1	Empirical example: Adolescent delinquency	187
7.3.2	Why conduct LTA on the adolescent delinquency data?	188
7.3.3	Estimation and assessing model fit	189
7.3.4	Model fit in the adolescent delinquency example	190
7.4	LTA model parameters	192
7.4.1	Latent status prevalences	192
7.4.2	Item-response probabilities	193
7.4.3	Transition probabilities	195
7.5	LTA: Model and notation	196
7.5.1	Fundamental expression	198
7.6	Degrees of freedom associated with latent transition models	199

7.6.1	Computing the number of latent status prevalences estimated	199
7.6.2	Computing the number of item-response probabilities estimated	200
7.6.3	Computing the number of transition probabilities estimated	200
7.7	Empirical example: Adolescent depression	201
7.7.1	Latent status prevalences	203
7.7.2	Item-response probabilities	204
7.7.3	Transition probabilities	205
7.8	Empirical example: Dating and sexual risk behavior	207
7.9	Interpreting what a latent transition model reveals about change	209
7.10	Parameter restrictions in LTA	211
7.11	Testing the hypothesis of measurement invariance across times	212
7.11.1	Empirical example: Adolescent depression	213
7.12	Testing hypotheses about change between times	214
7.13	Relation between RMLCA and LTA	217
7.13.1	Relation between RMLCA and LTA when there are two times	217
7.13.2	Relation between RMLCA and LTA when there are three or more times	218
7.13.3	When to use RMLCA versus LTA	220
7.14	Invariance of the transition probability matrix	221
7.15	Suggested supplemental readings	221
7.16	Points to remember	223
7.17	What's next	224
8	Multiple-Group LTA and LTA with Covariates	225
8.1	Overview	225
8.2	LTA with a grouping variable	226
8.2.1	Empirical example: Adolescent depression	226
8.3	Multiple-group LTA: Model and notation	226
8.4	Computing the number of parameters estimated in multiple-group latent transition models	228
8.5	Hypothesis tests concerning group differences: General considerations	229
8.6	Overall hypothesis tests about group differences in LTA	230

8.6.1	Empirical example: Cohort differences in adolescent depression	230
8.6.2	Empirical example: Gender differences in adolescent depression	233
8.7	Testing the hypothesis of equality of latent status prevalences	235
8.7.1	Empirical example: Gender differences in adolescent depression	236
8.7.2	Empirical example: Gender differences in dating and sexual risk behavior	237
8.8	Testing the hypothesis of equality of transition probabilities	238
8.8.1	Empirical example: Gender differences in adolescent depression	240
8.9	Incorporating covariates in LTA	241
8.9.1	Missing data and preparing variables for use as covariates	241
8.10	LTA with covariates: Model and notation	242
8.10.1	Predicting latent status membership	243
8.10.2	Predicting transitions between latent statuses	243
8.10.3	Hypothetical example of LTA with covariates	244
8.10.4	What is estimated	245
8.11	Hypothesis testing in LTA with covariates	246
8.11.1	Empirical example of predicting latent status membership at Time 1: Adolescent depression	247
8.11.2	Empirical example of predicting latent status membership at Time 1: Dating and sexual risk behavior	250
8.11.3	Empirical example of predicting transitions between latent statuses: Adolescent depression	252
8.11.4	Empirical example of predicting transitions between latent statuses: Dating and sexual risk behavior	256
8.12	Including both a grouping variable and a covariate in LTA	257
8.12.1	Empirical example: Dating and sexual risk behavior	258
8.13	Binomial logistic regression	258
8.13.1	Empirical example: Adolescent depression	259
8.13.2	Empirical example: Dating and sexual risk behavior	261
8.14	The relation between multiple-group LTA and LTA with a covariate	263
8.15	Suggested supplemental readings	263
8.16	Points to remember	264
