
CONTENTS

Preface to second edition	xvii
Preface to first edition	xix
1. Introduction	1
1.1. Partial differential equations	1
1.2. Examples	3
1.2.1. Single partial differential equations	3
1.2.2. Systems of partial differential equations	6
1.3. Strategies for studying PDE	6
1.3.1. Well-posed problems, classical solutions	7
1.3.2. Weak solutions and regularity	7
1.3.3. Typical difficulties	9
1.4. Overview	9
1.5. Problems	12
1.6. References	13

**PART I: REPRESENTATION FORMULAS
FOR SOLUTIONS**

2. Four Important Linear PDE	17
2.1. Transport equation	18
2.1.1. Initial-value problem	18
2.1.2. Nonhomogeneous problem	19
2.2. Laplace's equation	20

2.2.1. Fundamental solution	21
2.2.2. Mean-value formulas	25
2.2.3. Properties of harmonic functions	26
2.2.4. Green's function	33
2.2.5. Energy methods	41
2.3. Heat equation	44
2.3.1. Fundamental solution	45
2.3.2. Mean-value formula	51
2.3.3. Properties of solutions	55
2.3.4. Energy methods	62
2.4. Wave equation	65
2.4.1. Solution by spherical means	67
2.4.2. Nonhomogeneous problem	80
2.4.3. Energy methods	82
2.5. Problems	84
2.6. References	90
3. Nonlinear First-Order PDE	91
3.1. Complete integrals, envelopes	92
3.1.1. Complete integrals	92
3.1.2. New solutions from envelopes	94
3.2. Characteristics	96
3.2.1. Derivation of characteristic ODE	96
3.2.2. Examples	99
3.2.3. Boundary conditions	102
3.2.4. Local solution	105
3.2.5. Applications	109
3.3. Introduction to Hamilton–Jacobi equations	114
3.3.1. Calculus of variations, Hamilton's ODE	115
3.3.2. Legendre transform, Hopf–Lax formula	120
3.3.3. Weak solutions, uniqueness	128
3.4. Introduction to conservation laws	135
3.4.1. Shocks, entropy condition	136
3.4.2. Lax–Oleinik formula	143
3.4.3. Weak solutions, uniqueness	148

3.4.4. Riemann's problem	153
3.4.5. Long time behavior	156
3.5. Problems	161
3.6. References	165
4. Other Ways to Represent Solutions	167
4.1. Separation of variables	167
4.1.1. Examples	168
4.1.2. Application: Turing instability	172
4.2. Similarity solutions	176
4.2.1. Plane and traveling waves, solitons	176
4.2.2. Similarity under scaling	185
4.3. Transform methods	187
4.3.1. Fourier transform	187
4.3.2. Radon transform	197
4.3.3. Laplace transform	203
4.4. Converting nonlinear into linear PDE	206
4.4.1. Cole–Hopf transformation	206
4.4.2. Potential functions	208
4.4.3. Hodograph and Legendre transforms	209
4.5. Asymptotics	211
4.5.1. Singular perturbations	212
4.5.2. Laplace's method	217
4.5.3. Geometric optics, stationary phase	219
4.5.4. Homogenization	230
4.6. Power series	233
4.6.1. Noncharacteristic surfaces	233
4.6.2. Real analytic functions	238
4.6.3. Cauchy–Kovalevskaya Theorem	240
4.7. Problems	245
4.8. References	250

PART II: THEORY FOR LINEAR PARTIAL DIFFERENTIAL EQUATIONS

5. Sobolev Spaces	255
5.1. Hölder spaces	256

5.2. Sobolev spaces	257
5.2.1. Weak derivatives	257
5.2.2. Definition of Sobolev spaces	260
5.2.3. Elementary properties	263
5.3. Approximation	266
5.3.1. Interior approximation by smooth functions	266
5.3.2. Approximation by smooth functions	267
5.3.3. Global approximation by smooth functions	268
5.4. Extensions	270
5.5. Traces	273
5.6. Sobolev inequalities	277
5.6.1. Gagliardo–Nirenberg–Sobolev inequality	278
5.6.2. Morrey’s inequality	282
5.6.3. General Sobolev inequalities	286
5.7. Compactness	288
5.8. Additional topics	291
5.8.1. Poincaré’s inequalities	291
5.8.2. Difference quotients	293
5.8.3. Differentiability a.e.	297
5.8.4. Hardy’s inequality	298
5.8.5. Fourier transform methods	299
5.9. Other spaces of functions	301
5.9.1. The space H^{-1}	301
5.9.2. Spaces involving time	303
5.10. Problems	307
5.11. References	311
6. Second-Order Elliptic Equations	313
6.1. Definitions	313
6.1.1. Elliptic equations	313
6.1.2. Weak solutions	315
6.2. Existence of weak solutions	317
6.2.1. Lax–Milgram Theorem	317
6.2.2. Energy estimates	319
6.2.3. Fredholm alternative	322

6.3. Regularity	328
6.3.1. Interior regularity	329
6.3.2. Boundary regularity	336
6.4. Maximum principles	346
6.4.1. Weak maximum principle	346
6.4.2. Strong maximum principle	349
6.4.3. Harnack's inequality	353
6.5. Eigenvalues and eigenfunctions	356
6.5.1. Eigenvalues of symmetric elliptic operators	356
6.5.2. Eigenvalues of nonsymmetric elliptic operators	362
6.6. Problems	367
6.7. References	372
7. Linear Evolution Equations	373
7.1. Second-order parabolic equations	373
7.1.1. Definitions	374
7.1.2. Existence of weak solutions	377
7.1.3. Regularity	382
7.1.4. Maximum principles	391
7.2. Second-order hyperbolic equations	400
7.2.1. Definitions	400
7.2.2. Existence of weak solutions	403
7.2.3. Regularity	410
7.2.4. Propagation of disturbances	416
7.2.5. Equations in two variables	420
7.3. Systems of hyperbolic first-order equations	423
7.3.1. Definitions	423
7.3.2. Symmetric hyperbolic systems	425
7.3.3. Systems with constant coefficients	431
7.4. Semigroup theory	435
7.4.1. Definitions, elementary properties	436
7.4.2. Generating contraction semigroups	441
7.4.3. Applications	443
7.5. Problems	448
7.6. References	451

PART III: THEORY FOR NONLINEAR PARTIAL DIFFERENTIAL EQUATIONS

8. The Calculus of Variations	455
8.1. Introduction	455
8.1.1. Basic ideas	455
8.1.2. First variation, Euler–Lagrange equation	456
8.1.3. Second variation	460
8.1.4. Systems	461
8.2. Existence of minimizers	467
8.2.1. Coercivity, lower semicontinuity	467
8.2.2. Convexity	469
8.2.3. Weak solutions of Euler–Lagrange equation	474
8.2.4. Systems	477
8.2.5. Local minimizers	482
8.3. Regularity	484
8.3.1. Second derivative estimates	485
8.3.2. Remarks on higher regularity	488
8.4. Constraints	490
8.4.1. Nonlinear eigenvalue problems	490
8.4.2. Unilateral constraints, variational inequalities	494
8.4.3. Harmonic maps	497
8.4.4. Incompressibility	499
8.5. Critical points	503
8.5.1. Mountain Pass Theorem	503
8.5.2. Application to semilinear elliptic PDE	509
8.6. Invariance, Noether’s Theorem	513
8.6.1. Invariant variational problems	514
8.6.2. Noether’s Theorem	515
8.7. Problems	522
8.8. References	527
9. Nonvariational Techniques	529
9.1. Monotonicity methods	529
9.2. Fixed point methods	535
9.2.1. Banach’s Fixed Point Theorem	536

9.2.2. Schauder's, Schaefer's Fixed Point Theorems . .	540
9.3. Method of subsolutions and supersolutions	545
9.4. Nonexistence of solutions	549
9.4.1. Blow-up	549
9.4.2. Derrick–Pohozaev identity	553
9.5. Geometric properties of solutions	556
9.5.1. Star-shaped level sets	556
9.5.2. Radial symmetry	557
9.6. Gradient flows	562
9.6.1. Convex functions on Hilbert spaces	562
9.6.2. Subdifferentials and nonlinear semigroups	567
9.6.3. Applications	573
9.7. Problems	575
9.8. References	579
10. Hamilton–Jacobi Equations	581
10.1. Introduction, viscosity solutions	581
10.1.1. Definitions	583
10.1.2. Consistency	585
10.2. Uniqueness	588
10.3. Control theory, dynamic programming	592
10.3.1. Introduction to optimal control theory	593
10.3.2. Dynamic programming	594
10.3.3. Hamilton–Jacobi–Bellman equation	596
10.3.4. Hopf–Lax formula revisited	602
10.4. Problems	605
10.5. References	608
11. Systems of Conservation Laws	611
11.1. Introduction	611
11.1.1. Integral solutions	614
11.1.2. Traveling waves, hyperbolic systems	616
11.2. Riemann's problem	623
11.2.1. Simple waves	623
11.2.2. Rarefaction waves	626
11.2.3. Shock waves, contact discontinuities	627

11.2.4. Local solution of Riemann's problem	634
11.3. Systems of two conservation laws	637
11.3.1. Riemann invariants	637
11.3.2. Nonexistence of smooth solutions	641
11.4. Entropy criteria	643
11.4.1. Vanishing viscosity, traveling waves	644
11.4.2. Entropy/entropy-flux pairs	648
11.4.3. Uniqueness for scalar conservation laws	651
11.5. Problems	656
11.6. References	659
12. Nonlinear Wave Equations	661
12.1. Introduction	661
12.1.1. Conservation of energy	662
12.1.2. Finite propagation speed	662
12.2. Existence of solutions	665
12.2.1. Lipschitz nonlinearities	665
12.2.2. Short time existence	668
12.3. Semilinear wave equations	672
12.3.1. Sign conditions	672
12.3.2. Three space dimensions	676
12.3.3. Subcritical power nonlinearities	678
12.4. Critical power nonlinearity	681
12.5. Nonexistence of solutions	688
12.5.1. Nonexistence for negative energy	689
12.5.2. Nonexistence for small initial data	691
12.6. Problems	693
12.7. References	698

APPENDICES

Appendix A: Notation	699
A.1. Notation for matrices	699
A.2. Geometric notation	700
A.3. Notation for functions	701
A.4. Vector-valued functions	705
A.5. Notation for estimates	706

A.6. Some comments about notation	706
Appendix B: Inequalities	707
B.1. Convex functions	707
B.2. Useful inequalities	708
Appendix C: Calculus	712
C.1. Boundaries	712
C.2. Gauss–Green Theorem	714
C.3. Polar coordinates, coarea formula	715
C.4. Moving regions	716
C.5. Convolution and smoothing	716
C.6. Inverse Function Theorem	719
C.7. Implicit Function Theorem	720
C.8. Uniform convergence	721
Appendix D: Functional Analysis	722
D.1. Banach spaces	722
D.2. Hilbert spaces	723
D.3. Bounded linear operators	724
D.4. Weak convergence	726
D.5. Compact operators, Fredholm theory	727
D.6. Symmetric operators	731
Appendix E: Measure Theory	732
E.1. Lebesgue measure	732
E.2. Measurable functions and integration	734
E.3. Convergence theorems for integrals	735
E.4. Differentiation	735
E.5. Banach space-valued functions	736
Bibliography	739
Index	745
