1 Introduction	6
1.1 Substance of 3D numerical models of the transient temperature and heterogeneity field	7
1.2 Abstracts of the chapters 2 to 10	8
1.3 Literature	12
2 Numerical optimization of the method of cooling of a massive casting of ductile cast-iron.....	14
2.1 Introduction	14
2.2 Assignment and proposal of the calculation of the 3D temperature field of a massive casting (a block)	14
2.3 Temperature measurement	17
2.4 The calculation and experimental results	17
2.5 The relation between the model of the temperature field and the model of structural and chemical heterogeneity	18
2.5.1 Aims and methodology	18
2.5.2 Experimental material and methods.....	18
2.5.3 Quantitative metallographic analysis and chemical heterogeneity of samples.....	19
2.5.4 Local solidification time.....	20
2.5.5 Results and their discussion	20
2.6 Conclusion	21
2.7 Literature	22
3 Chemical and structural heterogeneity of a gravitationally cast ductile- cast-iron roller and its relationship to thermokinetic solidification ..	23
3.1 Introduction.....	23
3.2 The assignment and proposal of the calculation of the 3D temperature field.....	23
3.3 Temperature measurements of the temperatures inside the iron mould and on the surface of the roller	25
3.4 Calculated versus measured temperatures	26
3.5 The results of the simulation of the temperature field in dependence on the separator thickness	27
3.6 Structural and chemical heterogeneity of the roller	29
3.6.1 Structural heterogeneity	31
3.6.2 Chemical heterogeneity	33
3.7 Conclusion	34
3.8 Literature.....	35
4 Numerical optimization of the pouring of a stone-block from ceramic material EUCOR	37
4.1 Introduction.....	37
4.2 The assignment and proposal of the calculation of the 3D temperature field.....	37
4.3 Temperature measurements of the temperatures inside the system original casting - mould. Calculated versus measured temperatures.....	39
4.4 Optimization of the original riser.....	43
4.5 The model of the chemical heterogeneity and its application.....	45
4.5.1 Consequences of the chemical heterogeneity model	47
4.6 Conclusion	48
4.7 Literature.....	48
5 Numerical models of temperature field of a concasting.....	50
5.1 Introduction.....	50

5.2	An original off-line model of the temperature field of the concast steel billet 150 × 150 mm	51
5.3	An original off-line model of the temperature field of the concast steel slab 1 530 × 250 mm (width × thickness)	56
5.4	A parametric study of casting of the slab 1 530 × 250 mm (width × thickness).....	58
5.4.1	A study on the effect of the chemical composition on the resultant temperature field.....	58
5.4.2	A study on the effect of the casting speed (11325 class steel).....	60
5.4.3	The influence of the superheating temperature (11325 class steel)	62
5.4.4	The influence of the slab thickness	62
5.4.5	Importance of the off-line model	64
5.5	An on-line (dynamic) model of a temperature field of the concast steel slab.....	65
5.5.1	Importance of the on-line model	71
5.6	Experimental measurement for the application of the model of the temperature field of a steel slab 1 530 × 250 mm	72
5.6.1	Measuring temperatures in the mould (crystallizer) and in the secondary-cooling zone.....	73
5.6.2	Measuring of cooling effect of nozzles	75
5.6.3	Measuring of slab surface temperatures in the tertiary cooling zone.....	78
5.6.4	Measuring of the metallurgical length	78
5.7	Experimental measurement for the application of the model of the temperature field of a steel billet 150 × 150 mm.....	79
5.7.1	Measuring temperatures in the mould (crystallizer) and in the secondary-cooling zone.....	79
5.7.2	Measuring of cooling effect of nozzles	82
5.7.3	Conclusion	82
5.8	Literature	83
6	The connection of the models of temperature field (model A) and chemical heterogeneity (model B)	85
6.1	Characterization of continuously cast steel slab solidification by means of chemical micro-heterogeneity assessment.....	85
6.1.1	Introduction	85
6.1.2	Methodology of chemical heterogeneity investigation	85
6.1.3	Application of methodology of chemical heterogeneity investigation – investigation into chemical micro-heterogeneity of concast steel slab	86
6.1.4	Results and discussion	90
6.1.5	Conclusion	92
6.2	Interconnection of the models	92
6.3	Investigation of influence of cooling rate on back diffusion at solidification of concast steel billet 150 × 150 mm.....	100
6.3.1	Theoretical basis – modelling of non-equilibrium micro-segregation	100
6.3.2	Results of investigation of cooling rate influence on back diffusion of selected elements at solidification of the steel billet and their discussion	101
6.3.3	Conclusion	104
6.4	Literature	105
7	The possibilities of verifying the cross cracking mechanism in the concast steel slab 1 300 × 145 mm	107
7.1	Introduction	107
7.2	The results of the simulation of the temperature field of the slab.....	108
7.3	Morphology and heterogeneity of a transversal crack in the slab.....	111
7.3.1	Measurement of the concentration series of elements within the steel matrix.....	111
7.3.2	Measurement of the concentration of elements at the crack-surface	113
7.3.3	Measurement of the concentration of elements in the steel matrix.....	114

7.3.4	Measurement of the concentration of elements at the original crack-surface.....	114
7.3.5	Discussion.....	115
7.3.6	Conclusion	115
7.4	Fracture behaviour of analysed slabs	115
7.4.1	Fracture behaviour of continuously cast slab A in the temperature interval from 25 °C to 1 450 °C	116
7.4.2	Influence of temperature on morphology of rupture of the slab A	117
7.4.3	Progress of rupture of continuously cast slab B with cross crack.....	118
7.4.4	Discussion of obtained results – comparison of fractures of analysed cast slabs	119
7.4.5	Conclusion	120
7.5	Literature.....	121
8	Analysis of atypical breakout during radial continuous casting of a slab 250 × 1 530 mm in the straightening zone	123
8.1	Numerical simulation of temperature field of a slab.....	123
8.1.1	Introduction.....	123
8.1.2	Interruption of continuous casting	123
8.1.3	Results of numerical simulation of the slab A and B.....	124
8.1.4	Conclusion	131
8.2	Analysis of the causes of the breakout by application of the theory of physical similarity	132
8.2.1	Introduction.....	132
8.2.2	Occurrence of atypical breakout and stopping of the casting machine.....	132
8.2.3	Application of theory of physical similarity	133
8.2.4	Dimensionless similarity criteria and their characteristics	135
8.2.5	Numerical values of criteria and their discussion	137
8.2.6	Conclusion	138
8.3	Experimental research on the causes of the breakout	139
8.3.1	Introduction.....	139
8.3.2	Experiment.....	140
8.3.3	Results and their discussion	140
8.3.4	Conclusion	144
8.4	Literature.....	144
9	Electromagnetic stirring (EMS) of the melt of concast billets and its importance.....	146
9.1	Introduction.....	146
9.2	The conditions of the experiment.....	147
9.3	Evaluating experiments.....	148
9.4	Discussion	149
9.5	Conclusions.....	150
9.6	Literature.....	151
10	Method for measurement of chemical micro-heterogeneity of carbon in continuously cast billets	152
10.1	Introduction.....	152
10.2	Conditions of samples preparation and procedure of measurement	152
10.2.1	Measurement of concentration of elements	153
10.2.2	Detectability limit and measurement errors	153
10.3	Results of measurements.....	154
10.4	Conclusions.....	158
10.5	Literature.....	158
11	Symbols	159
