

CONTENTS

VOLUME 34A

A HISTORY OF BIOCHEMISTRY

Molecular correlates of biological concepts

General Preface	vii
Preface to Volume 34A	viii
List of Plates	xii
Contents	xiii

Part I. The Long, Long Way to Molecular Order

Chapter 1. Molecules and macromolecules

1. The organic molecules of Buffon	3
2. The representative shapes of molecules: Ampère (1814)	7
3. Molecular geometries for organic compounds: Kekulé (1858)	9
4. The notion of macromolecules: Staudinger (1922)	12
References	21

Chapter 2. From culture broth to primordial soup

1. Introduction	23
2. The Brownian motion	24
3. Measuring dimensions of colloidal particles	26
4. Sedimentation of hemoglobin	28
5. Conclusions	31
References	34

Chapter 3. Morphology of molecules

References	40
------------------	----

Chapter 4. The analogy between biomolecular structure and architecture

1. Linus Pauling, as the pioneer molecular architect	41
2. Aaron Klug, and the input from the geodesic domes of Buckminster Fuller	46
References	52

Chapter 5. The animate and the inanimate. Crystals and life

1. Living crystallizations	55
2. The crystallization analogy	59
3. The crystal–gene analogy	61
4. Final remarks	65
References	67

Chapter 6. Complementarities between molecules

1. The affinity between chemical complementarities in Chinese thought	69
2. Complementarities in Western alchemy	71
3. The concept of complementarity and the key-and-lock analogy of Emil Fischer	75
4. The concept of complementarity for Linus Pauling	78
References	85

Chapter 7. Philosophical undercurrents of the resistance to the notion of biomolecules as ordered polymers

1. The mechanistic view of life processes	88
2. The vitalistic view of life processes	89
3. And what was the question?	90
4. Kant raises the level of the debate	91
5. The aftermath to the <i>Critique of Judgment</i>	94
6. Materialist vitalism in France	101
7. Angry young men in Germany	107
8. Liebig sits on the fence	115
9. Claude Bernard's attempt at bridging the two viewpoints	121
10. Concluding statement	125
References	127

Chapter 8. Schizoid tale of two schools

1. An eighteenth-century natural philosopher	129
2. Loeb and the Arrhenius physicochemical program for biology	134
3. Wolfgang Ostwald and the colloidal school	137
4. Physicochemical studies on proteins	142
5. The controversy: proteins as molecules or as colloids?	145
6. Philosophical coda: mechanism versus vitalism	153
References	157

Part II. Proteins as Molecules

Chapter 9. The name ‘protein’

References	171
------------------	-----

Chapter 10. The conceptualization of albumins as a class

References	175
------------------	-----

Chapter 11. Crystallization of proteins and the molecular weight of hemoglobin

References	184
------------------	-----

Chapter 12. Polypeptidic nature of proteins

1. A history of slow progress: isolation of amino acids from hydrolysates of proteins	185
2. A discourse on the hybrid status of physiological chemistry in Germany during the second half of the nineteenth century	191
3. The polypeptide syntheses and theory of Emil Fischer	195
4. Vindication of the polypeptide theory	201
References	207

Chapter 22. Determination of phases in single crystals

.....
.....
.....
.....

Chapter 13. Dorothy Wrinch: the mystique of cyclol theory, or the story of a mistaken scientific theory

1. To be young, gifted and a woman	210
2. The protein research problem in 1936	213
3. Nature of the secondary bonds	215
4. Model building	217
5. The collaboration with Irving Langmuir	224
6. The downfall of cyclol theory	225
7. Some reflections about the cyclol theory	233
8. The seminal influence of Kepler	236
9. A postscript upon numerological speculations	240
References	245

Chapter 14. A note on two wise men

1. The diversity among eminent scientists	249
2. Desmond Bernal (1901–1971): a mini-biography	250
3. D'Arcy Wentworth Thompson (1860–1948): a portrait	255
4. Reasons for the widespread influence of these two wise men	257
References	260

Chapter 15. Molecular order in proteins: the contributions from Linus Pauling

1. Pauling and bonding theory	261
2. The protein research problem for Linus Pauling	264
3. Nature of the secondary bonds	273
4. Model building	277
5. The confirmation from Max Perutz	282
6. By way of commentary	284
References	286

Chapter 16. Sequence analysis

1. Introduction	289
2. First determination of the sequence of a simple peptide	294
3. Complete amino acid analysis of β -lactoglobulin	295

4. The sequence of insulin	296
References	308

Chapter 17. The Merrifield automated supported peptide synthesis

1. Inception	313
2. Implementation	314
3. Mechanization	317
References	320

Part III. The Hemoglobin Story

Chapter 18. Historical notes about hemoglobin and its various names

The red color of blood	322
References	330

Chapter 19. Cooperativity of dioxygen binding: the Bohr effect

References	344
------------------	-----

Chapter 20. Pauling and the magnetic properties of hemoglobins

References	351
------------------	-----

Chapter 21. Hemoglobin and the beginnings of x-ray work on proteins

References	358
------------------	-----

Chapter 22. Determination of phases in single crystals

1. Isomorphous replacement: principles	359
2. Isomorphous replacement in practice: the example of myoglobin	363

References	366
<i>Chapter 23. The x-ray structure of sperm-whale myoglobin</i>	
References	372
<i>Chapter 24. From the myoglobin to the hemoglobin structure</i>	
References	376
<i>Chapter 25. The hemoglobin structure and its molecular correlates for biological functions</i>	
1. Cooperativity of dioxygen binding	378
2. The Bohr effect	384
3. Concluding remarks	387
References	391
<i>Chapter 26. Molecular disease: sickle-cell hemoglobin</i>	
References	397
Part IV. Enzymes as Proteins	
<i>Chapter 27. Terminology: ferment, diastase, enzyme</i>	
References	405
<i>Chapter 28. Dissolution operators</i>	
References	410
<i>Chapter 29. Animal or vegetable origin of ferments</i>	
References	414

Chapter 30. A disquisition on an unfavorable Zeitgeist

References	417
------------------	-----

Chapter 31. Relation of microorganisms to fermentation and putrefaction

References	426
------------------	-----

Chapter 32. Ferments as catalysts

References	432
------------------	-----

Chapter 33. The Buchner experiment

References	442
------------------	-----

*Chapter 34. The aftermath of the Buchner experiment.
Crystallization of enzymes*

References	455
------------------	-----

Chapter 35. Enzymes as receptors complementary to their substrate

References	469
------------------	-----

Chapter 36. Enzymatic kinetics

References	476
------------------	-----

Chapter 37. X-ray studies on enzymes

References	482
------------------	-----

Part V. Hemoglobin and Enzymes

Chapter 38. Tentative sketch of a comparative history

References	496
<i>Subject Index</i>	497
<i>Name Index</i>	000
 Chapter 38. Tentative sketch of a comparative history	
1. Cooperativity of oxygenation 2. The Bohr effect 3. Binding curves 4. Properties of the hemoproteins a. Classification of enzymes <i>Chapter 36. Molecular disease: sickle-cell hemoglobin</i> b. Properties of the heme proteins <i>Chapter 37. Enzymes as catalysts</i> <i>Part IV. Enzymes as Proteins</i> 5. References <i>Chapter 27. Terminology: ferment, diastase, amylase</i> <i>Chapter 28. Dissolution catalysts</i> <i>Chapter 29. Animal or vegetable origin of enzymes</i> <i>Index to Part IV</i> 6. References <i>Chapter 27. Terminology: ferment, diastase, amylase</i> <i>Chapter 28. Dissolution catalysts</i> <i>Chapter 29. Animal or vegetable origin of enzymes</i> <i>Index to Part IV</i>	 378 384 385 391 392 393 398 399 400 406 407 408 410 411 412 414 415 416 418 419 420 422 423 424 426 427 428 429 430 431 432 433 434 436 437 438 439 440 441 442 443 444 446 447 448 449 450 451 452 453 454 456 457 458 459 460 461 462 463 464 466 467 468 469 470 471 472 473 474 476 477 478 479 480 481 482 483 484 486 487 488 489 490 491 492 493 494 495 496 497 498 499 500
