

BRIEF TABLE OF CONTENTS

PART I

CREATION OF AN ENVIRONMENT SUITABLE FOR THE ORIGIN OF LIFE 2

- CHAPTER 1 *Origin of the Elements* 5
CHAPTER 2 *Element Abundances of the Planets* 20
CHAPTER 3 *Geologic, Hydrologic, and Atmospheric Evolution of the Earth* 31

PART II

THE CHEMISTRY OF LIVING SYSTEMS 54

- CHAPTER 4 *The Chemicals of Living Systems* 57
CHAPTER 5 *Biochemical Catalysis* 87
CHAPTER 6 *Metabolic Strategies* 107
CHAPTER 7 *Structures and Metabolism of Nucleic Acids* 120
CHAPTER 8 *Protein Synthesis* 157

PART III

ORIGIN OF LIVING SYSTEMS 176

- CHAPTER 9 *General Considerations Concerning the Origin of Life on the Earth* 179
CHAPTER 10 *Prebiotic Synthesis of Small Bioorganic Molecules* 205
CHAPTER 11 *Prebiotic Synthesis of Polypeptides and Polynucleotides* 240
CHAPTER 12 *The Role of Clays and Nonclay Minerals in the Origin of Life* 260

PART IV

EVOLUTION OF LIVING SYSTEMS 280

- CHAPTER 13 *Evolution of Organisms* 283
CHAPTER 14 *Evolution of Energy-Producing Pathways* 317
CHAPTER 15 *Evolution of Photosynthesis* 337
CHAPTER 16 *Evolution of the Genetic Code* 378

CONTENTS

PART I CREATION OF AN ENVIRONMENT SUITABLE FOR THE ORIGIN OF LIFE 2

CHAPTER 1 *Origin of the Elements* 5

The Doppler Effect Shows That Most Stellar Bodies Are
Moving Away From Us 6

Observations on Distance and Rate of Separation Suggest
That the Universe Originated About 15 Billion Years Ago
9

The Chemical Composition of the Sun Approximates the
Chemical Composition of the Universe 11

The High Temperatures and Concentrations of Reactants
Required for Element Formation Are Most Likely to Exist
in the Core of Stars 13

Element Production After the Big Bang Started with Neutron
Decay 14

Elements Between Helium and Iron Were Produced in the
Centers of Stars 14

Formation of Elements Heavier Than Iron Starts with
Neutron Capture 16

Isotopes with Even Numbers of Protons Are Favored in
Element Formation 18

CHAPTER 2 *Element Abundances of the Planets* 20

The Planets Must Have Formed from the Same Nebula as the
Sun 21

Isotope Dating of Certain Meteorites Indicates That the Earth
Formed About 4.6 Billion Years Ago 22

Planets Differ in Mass, Density, and Composition 23

Chemical Clues Concerning the Earth's Composition Come
from Density Considerations and the Analysis of
Meteorites 26

- Terrestrial Abundance of the Elements Is a Function of
Element Abundance in the Universe, Chemical Reactions,
and the Loss of Volatiles 27
- The Jovian Planets Are Likely to Have Retained Their
Volatiles 29

CHAPTER 3 *Geologic, Hydrologic, and Atmospheric
Evolution of the Earth* 31

- The Earth Has a Layered Structure 32
- Evidence for the Layered Structure of the Earth Comes from
a Study of Seismic Waves 33
- Core Formation Occurred During the First Hundred Million
Years of the Earth's History 36
- Continental Movements Reflect Geologic Activity Within the
Mantle 36
- Tectonic Plates Are Composed of Old Granites and Young
Basalts 38
- Volcanoes and Quakes Reflect the Existence of Convection
Cells in the Upper Mantle 41
- Liquid Water Covers Two-Thirds of the Earth's Surface 41
- The Earth's Surface Temperature Has Been Delicately
Balanced for Almost 4 Billion Years 43
- Water and Carbon Dioxide Have Helped to Moderate the
Earth's Surface Temperature 43
- The Earth's Atmosphere Is Subdivided into Four Regions
47
- The Prebiotic Atmosphere Was a Reducing One 48

PART II *THE CHEMISTRY OF LIVING SYSTEMS* 54

CHAPTER 4 *The Chemicals of Living Systems* 57

- All Living Systems Are Related Through a Common
Evolution 58
- The Cell Is the Fundamental Unit of Life 58
- Basic Chemical Considerations 61
- Atoms Are Composed of Protons, Neutrons, and Electrons
64

There Are Over 90 Species of Atoms (Elements)	64
Atoms Combine to Form Molecules	66
<i>Ionic Bonds Form Between Oppositely Charged Atoms</i>	
66	
<i>Covalent Bonds Form Between Atoms That Share</i>	
<i>Electron Pairs</i>	67
Molecular Interactions Are Largely Due to Noncovalent Forces	68
Cells Are Composed of Small Molecules, Macromolecules, and Organelles	70
Weak Forces Result in Complex Folded Structures for Macromolecules	80
Biochemical Reactions Are a Subset of Ordinary Chemical Reactions	83

CHAPTER 5 *Biochemical Catalysis* 87

Thermodynamic and Kinetic Factors Determine Reaction Rates	88
All Catalysts Obey the Same Basic Set of Rules	91
Enzyme Catalysis Has Unique Features	94
Enzymes in the Trypsin Family Catalyze Peptide Chain Hydrolysis	96
Pancreatic RNase Is an Example of Concerted Acid-Base Catalysis	102
<i>The RNase Reaction Employs Two Strategically Placed Histidine Side Chains at the Active Site</i>	103

CHAPTER 6 *Metabolic Strategies* 107

Living Cells Require a Steady Supply of Starting Materials and Energy	108
Organisms Differ in Sources of Energy, Reducing Power, and Starting Materials for Biosynthesis	108
Reactions Are Organized into Sequences or Pathways	111
Sequentially Related Enzymes Are Frequently Clustered	111
Pathways Show Functional Coupling	114
A Thermodynamically Unfavorable Reaction Can Be Made Favorable by Coupling to the ATP-ADP System	115
The Activities of Pathways Are Regulated	118

CHAPTER 7	<i>Structures and Metabolism of Nucleic Acids</i>	120
	The Genetic Significance of Nucleic Acids	121
	Transformation Is DNA-Mediated	121
	Structural Properties of Nucleic Acids	123
	Most DNAs Exist as Double-Helix (Duplex) Structures	125
	Hydrogen Bonds and Stacking Forces Stabilize the Double Helix	127
	The Complementary Strands of DNA May Be Separated by Heating	130
	Cellular RNAs Form More Complex Structures Than DNAs	130
	DNA Replication	133
	The Universality of Semiconservative Replication	133
	Overview of DNA Replication in Bacteria	134
	<i>Growth During Replication Is Bidirectional</i>	136
	<i>Growth at the Replication Forks Is Discontinuous</i>	137
	<i>Many Proteins Are Involved in DNA Replication</i>	139
	<i>There Are Two Systems for DNA Repair</i>	142
	<i>Some DNA Polymerases Use RNA Templates</i>	143
	RNA, An Intermediary Carrying the Genetic Message?	144
	The First Known Enzyme That Could Catalyze Polyribonucleotide Synthesis Did Not Require a DNA Template	144
	DNA-RNA Complex Formation Was Used to Demonstrate That RNA Was Made on a DNA Template	144
	Weiss Discovered a DNA-Directed RNA Polymerase	146
	Overview of the Transcription Process	147
	Bacterial RNA Polymerase Contains Five Protein Subunits	147
	Comparison of <i>E. Coli</i> RNA Polymerase with DNA Polymerases	149
	Posttranscriptional Alterations of Transcripts	151
	<i>Processing and Modification of tRNA Requires Several Enzymes</i>	151
	<i>Eukaryotic Pre-mRNA Undergoes Extensive Processing</i>	151
	<i>Splicing Is a Two-Step Process</i>	153
	Some RNAs Function Like Protein Enzymes	153
	<i>Some RNAs Are Self-Splicing</i>	153
	Some Ribonucleases Are RNAs	154

Catalytic RNA May Have Profound Evolutionary
Significance 154

CHAPTER 8 *Protein Synthesis* 157

- The Cellular Machinery of Protein Synthesis 158
 - Transfer RNA Transports Amino Acids to the Template 158
 - Ribosomes Are the Site of Protein Synthesis 158
 - Messenger RNA Is the Template for Protein Synthesis 160
- The Steps in Translation 162
 - Amino Acids Are Activated Before Becoming Linked to Transfer RNA 162
 - Polypeptide Synthesis Is Initiated on the Ribosome 162
 - Elongation Reactions Involve Peptide Bond Formation and Translocation 162
 - Termination of Translation Requires Special Termination Codons 165
- Deciphering the Genetic Code 167
 - The Code Is Highly Degenerate 170
 - Wobble Introduces Ambiguity into Codon-Anticodon Interactions 170

PART III *ORIGIN OF LIVING SYSTEMS* 176

CHAPTER 9 *General Considerations Concerning the Origin of Life on the Earth* 179

- What Is Life and Where Did It Originate? 180
 - A Working Definition of Life 180
 - Reducing Nucleic-Acid-Based Life to Its Simplest Components* 181
 - Did Life Originate on the Earth Or Was It Transported Here from Elsewhere? 183
 - Conditions on the Prebiotic Earth Were Favorable to the Origin of Life* 185
- Basic Constraints 187
 - Both Thermodynamic and Kinetic Factors Are Important in Determining Which Reactions Will Be Favored 187

- The First RNA Enzymes Could Have Been Embellished by
Base Modifications and Coenzymes 256
- Increasing the Versatility of RNA by Folding 257
- Exploring the Full Potential of RNA as an Enzyme 257

CHAPTER 12 *The Role of Clays and Nonclay Minerals in the Origin of Life* 260

- Did "Living Clays" Precede Nucleic Acids? 261
- Clays Are Complexes of Cationic and Anionic Polymers
261
 - Oxycations Form Polycationic Polymers 261
 - Oxyanions Form Polyanionic Polymers 263
- Structural Properties of Clays 264
- Formation of Clays Is a Slow Process Attended by
Covalent Bond Formation 266
- Are Clays Capable of Inheritable Change? 268
- Could Clays or Nonclay Minerals Have Aided in the
Development of the First Living Systems? 269
- Associations Between Montmorillonite and Organic
Molecules 270
- Noncovalent Binding to Hydroxylapatite (HAP) 270
- Comparative Observations on Binding to Montmorillonite
and HAP 272
- Covalent Bond Formation Between Silicates and Carbon
Compounds 273
- Organic Reactions Catalyzed by Clays 275

PART IV EVOLUTION OF LIVING SYSTEMS 280

CHAPTER 13 *Evolution of Organisms* 283

- All Organisms Have a Common Origin 284
- The Classical Evolutionary Tree Is Based on Morphology
285
 - The Fossil Record Supplies Some of the Missing Pieces
of the Evolutionary Tree Puzzle 286
- The Geologic Time Scale Gives a Measure of Biologic
Time 288
- Biological Evolution Has Been Punctuated by Mass
Extinctions 288

The Biochemical Record	291
The Hemoglobin Family of Proteins Provides a Database for Evolutionary Investigations	293
Comparison of Ribosomal RNA Sequences Leads to a Modified Evolutionary Tree	294
Horizontal Evolution and the Origin of Eukaryotes Carrying Mitochondria and Chloroplasts	297
Recombination and Mutation Are the Ultimate Sources of Genetic Variability	298
Reproduction in Diploids Leads to Recombination of Genetic Determinants	298
Mutations Are Retained or Eliminated by the Process of Natural Selection	299
Mutations Can Arise Spontaneously or by Experimental Manipulation	302
<i>Mutations That Arise Normally Are Called Spontaneous Mutations</i>	304
<i>Induced Mutations Result from Deliberate Exposure to Mutagenic Agents</i>	305
The Discovery of New Genetic Phenomena Challenges Classical Evolutionary Theories	306
Environmental Factors Determine Which Mutations Will Be Favorable	308
Continental Movements	308
Regional Climatic Changes	311
Asteroid Bombardments	312
Changes in Atmospheric and Oceanic Oxygen Levels	313
Changes in Atmospheric Carbon Dioxide Levels	313
The Increasing Human Population Has an Ever Increasing Effect on the Environment	314

CHAPTER 14 *Evolution of Energy-Producing Pathways* 317

Carbohydrate Metabolism Differs in Anaerobes and Aerobes	318
Most Reactions of the TCA Cycle Existed Before There Was Aerobic Metabolism	323
The Sequence Between Oxaloacetate and Succinate Predates the TCA Cycle	325
Alternative Routes for Glutamate Synthesis	327
Carbon Dioxide Fixation in <i>Chlorobium Limicola</i> Uses the Entire TCA Cycle in the Reductive Direction	328

Some Aerobic "Specialists" Use Only Parts of the TCA
Cycle 330

Regulation of the TCA Cycle in Facultative Aerobic Bacteria
330

A Scheme for Evolution of the TCA Cycle in Prokaryotes
333

CHAPTER 15 *Evolution of Photosynthesis* 337 *William Parson*

Photosynthesis Depends on the Photochemical Reactivity of
Chlorophyll 341

Light Has the Properties of Both a Wave and a Particle 341
When Chlorophyll Absorbs a Photon, the Energy of the
Molecule Is Increased 343

Light Can Energize an Electron-Transfer Reaction 344

Photooxidation of Chlorophyll Generates a Free Radical
345

The Reactive Chlorophyll Is Found in Reaction Centers 346

Electrons Move from P870 to Bacteriopheophytin and Then
to Quinones 349

A Cyclic Electron-Transport Chain Moves Protons Across the
Membrane 351

An Antenna System Transfers Energy to the Reaction Centers
352

Chloroplasts Have Two Photosystems Linked in Series 353

Photosystem I Reduces NADP^+ by Way of Iron-Sulfur
Clusters 357

Oxygen Production Requires Accumulation of Four
Oxidizing Equivalents 357

Flow of Electrons from Water to NADP^+ Is Linked to Proton
Transport 359

Carbon Fixation in Many Species Depends on the Reductive
Pentose Cycle 359

Photosynthesis Arose Early in Evolution and Still Is
Widespread Among Eubacteria 361

The Photosynthetic Reaction Centers of Diverse Organisms
Fall into Two Groups 363

Early Evolution of Reaction Centers 366

Evolution of Antenna Systems 370

Possible Origins of the Oxygen-Evolving Complex 372

Possible Origins of PS-1 Reaction Centers 373

CHAPTER 16 *Evolution of the Genetic Code* 378

- Early Thoughts on the Evolution of the Genetic Code 379
- The Triplet Code May Have Evolved from a Relaxed Singlet or Doublet Code 379
- The Middle Base in the Codon May Have Been the First One to Acquire Meaning 380
- Amino Acids with Similar Side Chains Tend To Be Associated with Anticodons That Show Chemical Similarities 381
- Amino Acids in the Same Biosynthetic Pathway Use Similar Codons 383
- Amino Acids That Contain Chemically Similar Side Chains Frequently Share Two Code Letters 386
- There Is a Three-Base Periodicity in the Reading Frames That Reflects Codon Usage 387
- Synonym Codons Are Used to Varying Extents in a Species-Specific Manner 389
- The Code Is Not Quite Universal 389
- The Rules Regarding Codon-Anticodon Pairing Are Species-Specific 391
- The Change in the Use of a Codon or an Anticodon Is Likely to Follow the Route That Requires the Least Number of Steps 392
- Each Synthase Recognizes a Specific Amino Acid and Specific Regions on Its Cognate tRNA 393
