

CONTENTS

INTRODUCTION	VII
I CONSTRUCTION OF MULTISTOREY BUILDINGS GENERAL PROBLEMS	1
1 Multistorey buildings in Central Europe and abroad; the present state and develop- mental trends.	1
2 Causes of the growing complexity of buildings	5
2.1 Industrial production of structures	5
2.2 Reduction of structural mass	7
2.3 Prefabrication	7
2.4 More complex functions of buildings	11
2.5 Stricter economic aspects	11
3 Main problems of multistorey buildings from the point of view of load-bearing structures	12
4 Advances allowing erection of higher buildings	15
References	16
II PLANNING AND DESIGN	17
1 Position of planning and design in the investment activity system	17
2 Design as a process and creative work.	23
3 Types of task in the design system	26
4 Stages in designing: increase of specification level	29
5 Information — significant factors in the design process	32
III TALL BUILDINGS WITH SUBSYSTEMS AND ENVIRONMENT.	35
1 The tall building as large and complex system	35
2 Architectural work composed of subsystems: function — architecture — structure	39
3 Function and purpose of buildings	42
3.1 Classification of buildings according to purpose	42
3.2 Exploitation, services, environment	42
3.3 Functional requirements and purpose of structural solution	44
3.4 Layout scheme	45
4 Urbanism and architecture	46
5 Structures as a mass subsystem of building objects	49
5.1 Various aspects of structure	49
5.2 Structural solution depending on the purpose of the building.	51

6	Relevant surroundings of oversystem building object	55
6.1	Influences and restrictions	55
6.2	Building site influences	56
6.3	Available sources, capacity, production	57
6.4	Time horizon and time factor	58
7	Development trends and influences in structural design	59
7.1	Distribution of influences and trends	59
7.2	Interests of the community.	60
7.3	Influences, trends and contradictions in the spheres of investment and utilization	60
7.4	Influences and trends in the supplier's sphere.	61
	References	62
IV	LOAD-BEARING STRUCTURES OF MULTISTOREY BUILDINGS . . .	63
	Structures, statics, materials, construction, technology	63
1	Layout scheme and typology	64
2	Structural and static design	65
2.1	Classification of structures from the static viewpoint	65
2.2	Structural members and parts	67
2.3	Structural system with gravity and stabilizing subsystems	68
3	Materials and technology	71
3.1	General comments	71
3.1.1	Classification of structures according to materials and technology.	71
3.1.2	Construction process of load-bearing structures	74
3.1.3	Possibilities for increasing the effectiveness of load-bearing structures	76
3.2	Steel structures — materials, production and assembly	77
3.2.1	Principal characteristics	77
3.2.2	Different types of steel materials available according to the production technology used	78
3.2.3	Production programmes and dimensional conditions for delivery	79
3.2.4	Price conditions and the quality of materials	79
3.2.5	Production and assembly of steel structures: materials testing	80
3.2.6	Steel structures: development trends.	81
3.3	Reinforced concrete structures — material production.	82
3.3.1	Types of concrete and reinforcement: design parameters	82
3.3.1.1	Concrete.	82
3.3.1.2	Reinforcement	83
3.3.2	Production technologies of reinforced structures	85
3.3.2.1	Traditional reinforced structures	85
3.3.2.2	Industrially produced monolithic structures	85
3.3.2.3	An assembled reinforced concrete.	86
4	Combined steel-concrete structures	87
4.1	Typical properties of steel and concrete materials, reasons for their combination	87
4.2	Categories of combined steel-concrete structures	90
4.3	Composite steel-concrete structures	93
4.3.1	Characteristics of composite structures and their components	93
4.3.2	Design specialities.	94
4.3.2.1	Measurement of the elasticity of connections	94
4.3.2.2	Step behaviour of composite structures	95

4.3.2.3	Symmetric and asymmetric cross section	96
4.4	Types of steel-concrete structures	98
4.4.1	Set-up of steel-concrete members and cross sections	98
4.4.2	Transversely loaded steel-concrete elements	98
4.4.3	Longitudinally loaded steel-concrete elements	100
4.4.4	Steel sheet-concrete plates	102
5	Types of structural and static system	105
5.1	Basic and combined structural and static systems	105
5.2	Skeleton systems	106
5.2.1	Characteristic features	106
5.2.2	Transverse arrangement of frames	107
5.2.3	Longitudinal arrangement of frames	109
5.2.4	Crosswise arrangement of frames	109
5.3	Wall system; wall stiffening skeletons	111
5.4	Tube systems	111
5.5	Core systems and their combinations with other systems	115
5.5.1	Buildings with internal cores	115
5.5.2	Differentiation of core systems	117
5.5.3	Pure core systems	120
5.5.4	Core combined with a skeleton	123
5.5.5	Core combined with separate stiffening frames	126
5.5.6	Core combined with external tube	126
5.5.7	Production technology and structures of cores	126
6	Load-bearing systems and the determination of loading effects	128
6.1	Determination of loading effects	128
6.2	Spatial load-bearing systems constructed of complementary bonds	130
6.3	Calculation models of spatial systems	135
6.4	Generalized theory of thin-walled beams used for calculation of tall buildings	137
6.5	Practical approach to the determination of loading influences in spatial structural systems	142
6.5.1	Systems made of several bonds and subjected to generalized loading effects	142
6.5.2	Systems with two different bond rigidities	142
6.5.3	Systems constructed of open and closed structural bonds	144
	References	146

VII	VERTICAL STRUCTURES	263
1	Function, distribution and effects	263
2	Line members — columns and hangers	264
2.1	Static behaviour, layout	264
2.2	Columns.	265
2.2.1	Steel columns	265
2.2.2	Composite steel-concrete columns.	268
2.3	Hangers	271
3	Planar vertical bonds	274
3.1	Characteristics, distribution	274
3.2	Steel frame bonds.	276
3.2.1	Definition and location	276
3.2.2	Geometry of frames.	277
3.2.3	Cross sections and nodes of frames	280
3.2.4	Assembly members of frames.	285
3.2.5	Steel-concrete frame joints	286
3.3	Truss-lattice frames	286
3.3.1	Characteristics: location in layout scheme	286
3.3.2	Types of truss frames	287
3.3.3	Effects of horizontal and vertical loads	289

3.3.4	Structural design of truss frames	291
3.4	Stiffening walls	293
3.4.1	Characteristics, static behaviour and situation	293
3.4.2	Concrete stiffening walls	294
3.4.3	Steel stiffened wall systems	295
3.5	Location of vertical structures on the lower substructure.	295
