<b>About the Author</b>	<b>viii</b>
<b>Series Editor's Introduction</b>	<b>ix</b>
<b>Acknowledgments</b>	<b>xi</b>
<b>1. Introduction</b>	<b>1</b>
1.1 The Problem of Measurement in the Social Sciences	1
1.2 Measurement Theory and Item Response Theory for Dichotomous Items	2
1.3 Two Fundamentally Different IRT Models	2
<b>2. The Guttman Scale</b>	<b>5</b>
2.1 A Special Relation Between the Members of a Pair of Questions	5
2.2 Using Answers to Questions as Measurement	8
2.3 Ordinal Measurement With More Than Two Items	8
2.4 The Guttman Scale: The Perfect Deterministic Cumulative Scale	11
2.5 Assumptions of the Deterministic Model	12
2.6 Louis Guttman and the Guttman Scale	13
<b>3. The Imperfect Cumulative Scale</b>	<b>15</b>
3.1 Model Violations	15
3.2 Error: Violation of a Transitivity Relation Between Items and Subjects	15
3.3 Extension of the Definition of Error to a Larger Dataset	19
3.4 How Can We Evaluate the Amount of Model Violation in a Dataset?	20
3.5 Evaluating the Coefficient of Homogeneity	24
3.6 Using the Coefficient of Homogeneity in Scales With More Than Two Items	25

3.7	The "Cause" of Errors: Items or Subjects?	29
3.8	"Blaming" the Subjects: Transposing the Data Matrix and Calculating Subject Homogeneities	30
3.9	Using Imperfect Patterns to Measure Subject Scale Values	31
3.10	Conclusion	32
<b>4.</b>	<b>Confirmation or Exploration</b>	<b>33</b>
4.1	Searching for Subsets of Scalable Items	33
4.2	Items Not in the Scale: Rejection and Exclusion	35
<b>5.</b>	<b>An Example of a Cumulative Scale:</b>	
	<b>American Religious Beliefs</b>	<b>37</b>
5.1	Finding the Relevant Elementary Information	38
5.2	Summarizing the Necessary Elementary Information	39
5.3	Calculating the Homogeneity of Individual Items and of the Scale as a Whole	39
5.4	Testing Statistical Significance Against the Null Hypothesis	40
5.5	Using the Pairwise Information to Search for the Best Scale	41
5.6	Using the Transposed Dichotomous Data Matrix	42
5.7	Using the Parameters in Our Newly Found Scale	42
5.8	Conclusion	45
<b>6.</b>	<b>The Probabilistic Dominance Model: Monotone Homogeneity</b>	<b>46</b>
6.1	Imperfect or Probabilistic Responses?	46
6.2	Two Probabilistic Models: Monotone Homogeneity and Double Monotonicity	49
6.3	Testing the Model of Monotone Homogeneity	51
6.4	Testing Monotone Homogeneity of Our Five Religious Belief Items	54
<b>7.</b>	<b>The Probabilistic Dominance Model: Double Monotonicity</b>	<b>57</b>
7.1	The Importance of Double Monotonicity	57
7.2	Testing Double Monotonicity With External Groups	57
7.3	Testing Double Monotonicity With Restscore Groups	61
7.4	Testing Double Monotonicity With Restsplit Groups	64
7.5	Testing Double Monotonicity With the P(+,+) and P(-,-) Matrices	65
7.6	What Inferences Can We Draw From Tests of the Probabilistic Models?	69

<b>8. Cumulative Scaling With Polytomous Items</b>	<b>70</b>
8.1 Response Patterns in the Deterministic Cumulative Model for Polytomous Items	71
8.2 Using Social Scientific Items in the Deterministic Cumulative Scale	73
8.3 Evaluating Homogeneity	77
8.4 The Search Procedure for Polytomous Items	83
8.5 Applying the Probabilistic Model to Polytomous Items	84
8.6 The Scale of Political Action	86
<b>9. Remaining Issues</b>	<b>88</b>
9.1 Reliability Analysis	88
9.2 Factor Analysis	90
9.3 A Parametric IRT Model: The Rasch Model	92
9.4 Applying the Other Measurement Models to the American Belief Data	93
9.5 Nondiscriminating Response Patterns	94
9.6 Some Practical Matters	95
9.7 Some Final Remarks	96
<b>References</b>	<b>98</b>
<b>Selected Bibliography</b>	<b>101</b>
<b>Appendices</b>	<b>105</b>
1 The Null Distribution of the <b>H</b> Coefficient	105
2 Preventing Capitalizing on Chance	107
3 Calculation of Reliability	109
