About the Authors *ix*

Preface to the Second Edition *xi*

Preface to the First Edition *xiii*

1	Synthetic Design	1
1.1	Retrosynthetic Analysis	1
1.2	Reversal of the Carbonyl Group Polarity (Umpolung)	6
1.3	Steps in Planning a Synthesis	11
1.4	Choice of Synthetic Method	16
1.5	Domino Reactions (Cascade or Tandem Reactions)	18
1.6	Computer-Assisted Retrosynthetic Analysis	19
	References	19
2	Stereochemical Considerations in Planning Syntheses	21
2.1	Conformational Analysis	21
2.2	Evaluation of Non-Bonded Interactions	25
2.3	Six-Membered Heterocyclic Systems	29
2.4	Polycyclic Ring Systems	30
2.5	Cyclohexyl Systems with sp^2 -Hybridized Atoms	33
2.6	Significant Energy Difference	35
2.7	Computer-Assisted Molecular Modeling	35
2.8	Reactivity and Product Determination as a Function of Conformation	36
	References	42
3	The Concept of Protecting Functional Groups	45
3.1	Protection of N-H Groups	45
3.2	Protection of OH Groups	48
3.3	Protection of Diols as Acetals	55
3.4	Protection of Carbonyl Groups in Aldehydes and Ketones	56
3.5	Protection of the Carboxyl Group	62
3.6	Protection of Double Bonds	66
3.7	Protection of Triple Bonds	66
	References	66
4	Functional Group Transformations	71
4.1	Oxidation of Alcohols to Aldehydes and Ketones	71
4.2	Reagents and Procedures for Alcohol Oxidation	72
4.3	Chemoselective Oxidizing Agents	76
4.4	Oxidation of Acyloins	79
4.5	Oxidation of Tertiary Allylic Alcohols	79
4.6	Oxidative Procedures to Carboxylic Acids	80

- 4.7 Allylic Oxidation of Alkenes 82
- 4.8 Terminology for Reduction of Carbonyl Compounds 85
- 4.9 Nucleophilic Reducing Agents 86
- 4.10 Electrophilic Reducing Agents 91
- 4.11 Regio- and Chemoselective Reductions 93
- 4.12 Diastereoselective Reductions of Cyclic Ketones 97
- 4.13 Inversion of Secondary Alcohol Stereochemistry 98
- 4.14 Diastereofacial Selectivity in Acyclic Systems 99
- 4.15 Enantioselective Reductions 104
- References 108

5 Functional Group Transformations 115

- 5.1 Reactions of Carbon–Carbon Double Bonds 115
- 5.2 Reactions of Carbon–Carbon Triple Bonds 160
- References 167

6 Formation of Carbon–Carbon Single Bonds via Enolate Anions 175

- 6.1 1,3-Dicarbonyl Compounds 175
- 6.2 Direct Alkylation of Enolates 185
- 6.3 Cyclization Reactions—Baldwin's Rules for Ring Closure 193
- 6.4 Stereochemistry of Cyclic Ketone Alkylation 195
- 6.5 Imine and Hydrazone Anions 196
- 6.6 Enamines 197
- 6.7 The Aldol Reaction 199
- 6.8 Condensation Reactions of Enols and Enolates 213
- 6.9 Robinson Annulation 217
- References 220

7 Formation of Carbon–Carbon Bonds via Organometallic Reagents 227

- 7.1 Organolithium Reagents 227
- 7.2 Organomagnesium Reagents 236
- 7.3 Organotitanium Reagents 239
- 7.4 Organocerium Reagents 240
- 7.5 Organocopper Reagents 241
- 7.6 Organochromium Reagents 251
- 7.7 Organozinc Reagents 252
- 7.8 Organoboron Reagents 256
- 7.9 Organosilicon Reagents 264
- 7.10 Organogold Chemistry 274
- References 278

8 Palladium-Catalyzed Coupling Reactions 285

- 8.1 Palladium Oxidation State 285
- 8.2 Organic Synthesis with Palladium(0) Complexes 286
- 8.3 The Heck Reaction—Palladium(0)-Catalyzed Olefin Insertion Reactions 288
- 8.4 Palladium-Catalyzed Cross-Coupling with Organometallic Reagents 292
- 8.5 Cross-Coupling Reactions Involving sp-Carbons 301
- 8.6 The Trost–Tsuiji Reaction 304
- References 307

9 Formation of Carbon–Carbon π -Bonds 313

- 9.1 Formation of Carbon–Carbon Double Bonds 313

9.2	Formation of Carbon–Carbon Triple Bonds	343
	References	350
10	Syntheses of Carbocyclic Systems	355
10.1	Intramolecular Free Radical Cyclizations	355
10.2	Cation– π Cyclizations	361
10.3	Pericyclic Reactions	364
10.4	Ring-Closing Olefin Metathesis	375
	References	378
	About the Authors	
	Index	383

George S. Zweifel was born in Switzerland. He received his Dr. Sc. Techn. degree in 1955 from the Swiss Federal Institute of Technology (ETH Zürich, Switzerland, Professor H. Düggli) working in the area of carbohydrate chemistry. The award of a Swiss–British Exchange Fellowship in 1956 (University of Edinburgh, Scotland, Professor G. O. Aspinall) and a Research Fellowship in 1957 (University of Birmingham, England, Professors S. A. Barker and A. B. Forster) made it possible for him to study conformational problems in the carbohydrate field. In 1958, he became Professor H. C. Brown's personal research assistant at Purdue University, undertaking research in the new area of hydroboration chemistry. He joined the faculty at the University of California, Davis in 1963, where his research interest has been the exploitation of organometallics as intermediates in organic synthesis, with emphasis on unsaturated organoboron, organoaluminum, and organosilicon compounds.

Michael H. Nantz earned a Bachelor of Science degree from Western Kentucky University in 1981. His interest in natural product synthesis led him to work with Professor Philip L. Fuchs at Purdue University, where he received a PhD degree in 1987. Over the next 2 years, he studied asymmetric synthesis with Professor Samuel H. Danishefsky at the Massachusetts Institute of Technology. In 1989, he joined the faculty at the University of California, Davis and established a research program in organic synthesis with emphasis on the development of new delivery systems. In 1994, he joined the faculty at the University of Louisville as Professor of Chemistry and Distinguished University Scholar.

Peter Somfai was born in Sweden and received his PhD in 1987 from the Chalmers University of Technology. After a 2-year post doc in the group of Professor S. Masamune at the Massachusetts Institute of Technology, he returned to Sweden. In 1999, he was appointed as Professor at the Royal Institute of Technology (KTH) in Stockholm. He joined the faculty at Lund University in 2012, where he is Professor in organic chemistry. He is interested in the development of new methodology for organic synthesis and its application to the synthesis of complex organic molecules.
