0	Introduction	1
1	Gradient systems in Euclidean space	5
1.1	The space \mathbb{R}^d	5
1.2	Fréchet derivative	7
1.3	Euclidean gradient	8
1.4	Euclidean gradient systems	9
1.5	Algebraic equations and steepest descent	12
1.6	Exercises	13
2	Gradient systems in finite dimensional space	15
2.1	Definition of gradient	17
2.2	Definition of gradient system	18
2.3	Local existence for ordinary differential equations	18
2.4	Local and global existence for gradient systems	21
2.5	Newton's method	23
2.6	Exercises	25
3	Gradients in infinite dimensional space: the Laplace operator on a bounded interval	27
3.1	Definition of gradient	28
3.2	Gradients of quadratic forms	30
3.3	Sobolev spaces in one space dimension	31
3.4	The Dirichlet-Laplace operator on a bounded interval	33
3.5	The Dirichlet-Laplace operator with multiplicative coefficient	35
3.6	Exercises	37
4	Gradients in infinite dimensional space: the Laplace operator and the p-Laplace operator	39
4.1	Sobolev spaces in higher dimensions	39
4.2	The Dirichlet-Laplace operator	42

4.3	The Dirichlet- p -Laplace operator	44
4.4	An auxiliary result	46
4.5	Origins of the Laplace operator	49
4.6	Exercises	52
5	Bochner-Lebesgue and Bochner-Sobolev spaces	55
5.1	The Bochner integral	56
5.2	Bochner-Lebesgue spaces	58
5.3	Bochner-Sobolev spaces in one space dimension	59
5.4	Exercises	63
6	Gradient systems in infinite dimensional spaces: existence and uniqueness of solutions I	65
6.1	Gradient systems in infinite dimensional spaces	65
6.2	Global existence and uniqueness of solutions for gradient systems with convex energy	66
6.3	Exercises	75
7	Diffusion equations	77
7.1	Heat conduction	77
7.2	The reaction-diffusion equation	80
7.3	The Perona-Malik model in image processing	81
7.4	Global existence and uniqueness of solutions	81
7.5	Exercises	84
8	Gradient systems in infinite dimensional spaces: existence and uniqueness of solutions II	87
8.1	Global existence and uniqueness of solutions for gradient systems with elliptic energy	88
8.2	Exercises	97
9	Regularity of solutions	99
9.1	Interpolation	99
9.2	Time regularity – Angenent’s trick	101
9.3	Exercises	104
10	Existence of local solutions	107
10.1	The local inverse theorem and existence of local solutions of abstract differential equations	108
10.2	Gradients of quadratic forms and identification of the trace space	109
10.3	A semilinear diffusion equation	112
10.4	Exercises	117

11	Asymptotic behaviour of solutions of gradient systems	119
11.1	The ω -limit set of a continuous function on \mathbb{R}_+	120
11.2	A stabilisation result for global solutions of gradient systems	121
11.3	Nonstabilisation results for global solutions of gradient systems	123
11.4	Exercises	126
12	Asymptotic behaviour of solutions of gradient systems II	129
12.1	The Łojasiewicz-Simon inequality and stabilisation of global solutions of gradient systems	130
12.2	The Łojasiewicz-Simon inequality in Hilbert spaces	133
12.3	Exercises	138
13	Subgradients	141
13.1	Definition of subgradients	141
13.2	Subgradient versus gradient	142
13.3	The subgradient of convex functions	143
13.4	Minimisation of convex functions	145
13.5	Solution of $u + h\partial\mathcal{E}(u) \ni f$	146
14	Gradient systems in infinite dimensional spaces: existence and uniqueness of solutions III	151
14.1	The implicit Euler scheme	152
14.2	Proof of global existence and uniqueness of strong solutions	160
14.3	The exponential formula	162
15	Invariance of convex sets	165
15.1	Projection onto closed convex sets	165
15.2	Invariance of convex sets	166
15.3	Positivity preserving gradient systems	168
15.4	Order preserving gradient systems	168
15.5	L^∞ contractivity	170
15.6	The Dirichlet- p -Laplace operator	170
16	The universe, soap bubbles and curve shortening	175
A	Primer on topology	185
A.1	Metric spaces	185
A.2	Sequences, convergence	188
A.3	Compactness	190
A.4	Continuity	191
A.5	Completion of a metric space	192
B	Banach spaces and bounded linear operators	195
B.1	Normed spaces	195
B.2	Product spaces and quotient spaces	201
B.3	Bounded linear operators	204

B.4	The Arzela-Ascoli theorem	209
C	Calculus on Banach spaces	213
C.1	Differentiable functions between Banach spaces	213
C.2	Local inverse theorem and implicit function theorem	214
C.3	* Newton's method	218
D	Hilbert spaces	219
D.1	Inner product spaces	219
D.2	Orthogonal decomposition	223
D.3	* Fourier series	228
D.4	Linear functionals on Hilbert spaces	232
D.5	Weak convergence in Hilbert spaces	233
E	Dual spaces and weak convergence	237
E.1	The theorem of Hahn-Banach	237
E.2	Weak* convergence and the theorem of Banach-Alaoglu	243
E.3	Weak convergence and reflexivity	244
E.4	* Minimization of convex functionals	249
E.5	* The von Neumann minimax theorem	252
F	The divergence theorem (BY WOLFGANG ARENDT)	255
F.1	Open sets of class C^1	255
F.2	The divergence theorem	258
F.3	Proof of the divergence theorem	261
G	Sobolev spaces	267
G.1	Test functions, convolution and regularization	267
G.2	Sobolev spaces in one dimension	270
G.3	Sobolev spaces in several dimensions	276
G.4	* Elliptic partial differential equations	278
H	Bochner-Lebesgue and Bochner-Sobolev spaces	281
H.1	The Bochner integral	281
H.2	Bochner-Lebesgue spaces	284
H.3	Bochner-Sobolev spaces in one dimension	286
