Review: Random variables and sampling theory			1
<hr/>			
1 Covariance, variance, and correlation			
<hr/>			
1.1	Sample covariance		30
1.2	Some basic covariance rules		34
1.3	Alternative expression for sample covariance		35
1.4	Population covariance		37
1.5	Sample variance		38
1.6	Variance rules		39
1.7	Population variance of the sample mean		41
1.8	The correlation coefficient		41
1.9	Why covariance is not a good measure of association		45
<hr/>			
2 Simple regression analysis			
<hr/>			
2.1	The simple linear model		48
2.2	Least squares regression		50
2.3	Least squares regression: two examples		52
2.4	Least squares regression with one explanatory variable		56
2.5	Two decompositions of the dependent variable		59
2.6	Interpretation of a regression equation		60
2.7	Goodness of fit: R^2		65

3 Properties of the regression coefficients and hypothesis testing

3.1	The random components of the regression coefficients	70
3.2	A Monte Carlo experiment	71
3.3	Assumptions concerning the disturbance term	76
3.4	Unbiasedness of the regression coefficients	79
3.5	Precision of the regression coefficients	80
3.6	The Gauss–Markov theorem	87
3.7	Testing hypotheses relating to the regression coefficients	89
3.8	Confidence intervals	102
3.9	One-tailed t tests	105
3.10	The F test of goodness of fit	109
3.11	Relationship between the F test of goodness of fit and the t test on the slope coefficient in simple regression analysis	112

4 Multiple regression analysis

4.1	Illustration: a model with two explanatory variables	114
4.2	Derivation and interpretation of the multiple regression coefficients	116
4.3	Properties of the multiple regression coefficients	122
4.4	Multicollinearity	128
4.5	Goodness of fit: R^2	139

5 Transformations of variables

5.1	Basic procedure	149
5.2	Logarithmic transformations	153
5.3	The disturbance term	161
5.4	Nonlinear regression	163
5.5	Choice of function: Box–Cox tests	165

6 Dummy variables

6.1	Illustration of the use of a dummy variable	170
6.2	Extension to more than two categories and to multiple sets of dummy variables	176
6.3	Slope dummy variables	186
6.4	The Chow test	191

7 Specification of regression variables: a preliminary skirmish

7.1	Model specification	196
7.2	The effect of omitting a variable that ought to be included	197
7.3	The effect of including a variable that ought not to be included	205
7.4	Proxy variables	208
7.5	Testing a linear restriction	213
7.6	Getting the most out of your residuals	219

8 Heteroscedasticity

8.1	Heteroscedasticity and its implications	220
8.2	Detection of heteroscedasticity	225
8.3	What can you do about heteroscedasticity?	230

9 Stochastic regressors and measurement errors

9.1	Stochastic regressors	238
9.2	The consequences of measurement errors	240
9.3	Friedman's critique of the conventional consumption function	247
9.4	Instrumental variables	252

10 Simultaneous equations estimation	
10.1	Simultaneous equations models: structural and reduced form equations 261
10.2	Simultaneous equations bias 263
10.3	Instrumental variables estimation 267
11 Binary choice and limited dependent models, and maximum likelihood estimation	
11.1	The linear probability model 280
11.2	Logit analysis 283
11.3	Probit analysis 289
11.4	Censored regressions: tobit analysis 292
11.5	Sample selection bias 297
11.6	An introduction to maximum likelihood estimation 302
12 Models using time-series data	
12.1	Static models 311
12.2	Dynamic models 315
12.3	The adaptive expectations model 317
12.4	The partial adjustment model 325
12.5	Prediction 329
12.6	Stability tests 334
13 Autocorrelation	
13.1	Definition of autocorrelation 337
13.2	Detection of first-order autocorrelation: the Durbin–Watson test 338
13.3	What can you do about autocorrelation? 342
13.4	Autocorrelation with a lagged dependent variable 346
13.5	The common factor test 350
13.6	Apparent autocorrelation 355
13.7	Model specification: specific-to-general versus general-to-specific 358

14	Introduction to nonstationary time series	
14.1	Stationarity and nonstationarity	364
14.2	Consequences of nonstationarity	369
14.3	Detection of nonstationarity	372
14.4	Cointegration	380
14.5	Fitting models with nonstationary time series	384
14.6	Conclusion	387
	Appendix A: Statistical tables	388
	Appendix B: Data sets	396
	<i>Bibliography</i>	398
	<i>Author index</i>	401
	<i>Subject index</i>	402
