Preface	xii
Preface to First Edition	xvii
Introduction	xix
Chapter Summaries	xxvii
PART I PLANT STRATEGIES	1
Chapter 1 Primary Strategies in the Established Phase	3
Introduction	3
Classification by architecture	3
Two- and three-strategy models	4
The CSR classification	7
The untenable triangle	8
Tradeoffs	10
Competitors	10
A definition of competition between plants	11
Competition above and below ground	13
Characteristics which determine the competitive ability of established plants	14
Storage organs	14
Height	14
Lateral spread	16
Shoot thrust	18
Phenology	18
Leaf longevity	18
Root longevity	21
Growth rate	22
Leaf nutrients	22
Specific leaf area (SLA)	23
Rapid growth responses to localised resource depletions (active foraging)	23
Response to damage	29
Palatability	30
Intraspecific variation in competitive ability	30
Competition in productive and unproductive conditions	35

Rejection of the resource-ratio model of competitive ability	37
An alternative view; the R^* model of competition of Tilman	40
General features of competitors	46
Phenology and phenotypic plasticity	46
Life-form and ecology	48
Stress-tolerators	48
A definition of stress	48
Stress in productive and unproductive habitats	48
Tolerance of severe stress in various types of habitat	49
Stress-tolerance in arctic and alpine habitats	49
Stress-tolerance in arid habitats	51
Stress-tolerance in shaded habitats	52
Stress-tolerance in nutrient-deficient habitats	55
Stress-tolerance in urban habitats	63
General features of stress-tolerance	63
Stress-tolerance and mineral nutrition: a unifying hypothesis	65
Stress-tolerance and palatability	71
Stress-tolerance and decomposition	73
Stress-tolerance and carbon isotope fractionation	73
Stress-tolerance and symbiosis	76
Lichens	76
Mycorrhizas	76
Phosphorus scavengers	77
Nitrogen fixers	78
Stress-tolerance and facilitation	79
Ruderals	80
A definition of disturbance	80
Vegetation disturbance by climatic fluctuations	81
Adaptation to frequent and severe disturbance in various types of habitat	82
Ruderals of the sea-shore	82
Ruderals of marshland	82
Arable weeds	83
Ruderals of trampled ground	84
Desert annuals	84
Fire ephemerals	84
General features of ruderals	85
Life-cycle	85
Response to stress	85
Predictions arising from the CSR model	87
Three sets of traits	87
Three types of plant response to stress	88
Three types of life-history	92
Tests of the CSR model	94

CONTENTS	vii
Informal tests	94
Formal tests	95
Mathematical models	95
Cellular automaton models	96
Intraspecific studies	98
Screening of individual traits	98
Screening and multivariate analysis of many traits	99
Vegetation synthesis under controlled conditions	105
Reconciliation of C-, S-, and R-selection with the theory of r- and K-selection	110
Analogous strategies in fungi and in animals	112
Analogous strategies in economic systems	115
Chapter 2 Secondary Strategies in the Established Phase	116
Introduction	116
Competitive-ruderals	117
Annual herbs	118
Biennial herbs	120
Ruderal-perennial herbs	121
The general characteristics of competitive-ruderals	122
Stress-tolerant ruderals	124
Herbaceous plants	125
Small annuals and short-lived perennials	125
Small geophytes	126
Bryophytes	126
Stress-tolerant competitors	127
Herbaceous plants	127
Woody plants	128
‘C-S-R’ strategists	128
Small tussock grasses	130
Small, deep-rooted forbs	130
Small, creeping, or stoloniferous forbs	131
Strategy and life-form	131
Triangular ordination; ‘hard’ and ‘soft’ attributes	133
Intraspecific variation with respect to strategy	136
Chapter 3 Regenerative Strategies	138
Introduction	138
Regeneration by vegetative offspring and by sexually-derived seeds or spores	138
Types of regenerative strategy	139
Vegetative expansion (V)	139

Seasonal regeneration in vegetation gaps (S)	141
Autumn regeneration	141
Spring regeneration	143
General characteristics of seasonal regeneration	146
Regeneration involving a persistent bank of seeds or spores (B_s)	147
The distribution of persistent seed banks in relation to habitat	149
The mechanism of a persistent bank of buried seeds	151
Seed burial	151
Dormancy in buried seeds	153
Defences of persistent seeds	155
Initiation of germination in buried seeds	155
Dispersal of persistent seeds	159
Regeneration involving numerous wind-dispersed seeds or spores (W)	159
Regeneration involving a bank of persistent seedlings (B_{sd})	163
The role of animals in regeneration	165
Multiple strategies of regeneration	167
Regeneration failure	172
Failure in plants with a single regenerative strategy	172
Annual and biennial herbs	172
Trees and shrubs	173
Failure in plants with more than one regenerative strategy	175
Regenerative strategies in fungi and in animals	176
 PART II PLANT STRATEGIES AND VEGETATION PROCESSES	 177
 Chapter 4 Dominance	 179
Introduction	180
Dominance in herbaceous vegetation	180
Dominance by competitive-ruderals	180
Dominance by competitors	181
Dominance by stress-tolerant competitors	184
An index of dominance	184
Dominant effects of herbaceous perennials upon tree seedlings	187
Dominant effects of trees upon herbaceous plants	188
Dominant effects of trees upon other trees and shrubs	192
Success and failure in dominant plants	194
Dominance and allelopathy	195
Co-existence with dominant plants	196
Analogous phenomena involving animals	197

CONTENTS	ix
Chapter 5 Assembling of Communities	199
Introduction	199
Direct observations in the field	200
Dominants and subordinates	201
Transients	204
The role of subordinates and transients in communities	205
Filter effects of subordinates?	206
Founder effects of transients?	207
Manipulations of natural communities	208
Synthesis of communities: I Model assemblages	210
Recruitment of plant communities from the species pool	211
Control of relative abundance within communities	211
Synthesis of communities: II The matrix approach	213
Chapter 6 Rarification and Extinction	218
Introduction	218
Functional shifts and rarification within floras	218
Functional shifts and rarification within plant communities	220
Endangered species: an early warning system	223
Analogous phenomena involving fungi and animals	224
Chapter 7 Colonisation and Invasion	225
Introduction	225
Colonisers and invaders: a comparison	226
Community invasibility	229
Chapter 8 Succession	238
Introduction	238
Primary succession	239
Secondary succession in productive environments	241
Secondary succession in unproductive environments	245
Models of secondary succession	246
The role of herbivores in succession	247
Climax and proclimax	248
Regenerative strategies and vegetation dynamics	249
Regenerative strategies in secondary successions	250
Regenerative strategies in proclimax vegetation	250
Life forms, strategies, and productivity: a synthesis	251
Changes in vegetation stability and species richness during secondary successions	254

Chapter 9 Co-existence	257
Introduction	257
Co-existence in herbaceous vegetation	257
A model describing the control of species richness in herbaceous vegetation	261
Quantitative definition of the mechanism controlling species richness in herbaceous vegetation	263
Co-existence related to spatial variation in environment	267
Horizontal variation	267
Vertical stratification	269
Co-existence related to temporal variation in environment	271
Seasonal variation	271
Short-term variation	278
Long-term variation	278
Co-existence and mycorrhizas	284
Co-existence related to genetic variation within populations	286
Co-existence in woody vegetation	289
A general model	292
‘Reservoir effects’ upon species density	294
The contribution of epiphytes to species-rich vegetation	297
Control of species richness by vegetation management	297
Maintenance of monocultures in agricultural systems	297
Management of vegetation subject to trampling	298
Analogous phenomena involving animals	299
 PART III PLANT STRATEGIES AND ECOSYSTEM PROPERTIES	 301
 Chapter 10 Trophic Structure, Productivity, and Stability	 303
Introduction	303
Two examples	305
The Chernobyl legacy	305
Nitrogen retention at Cressbrookdale	308
Implications of the two examples	309
Effects of plant strategies on trophic structure	311
Direct observations in the field	312
Manipulations of ecosystems	316
Synthesis of ecosystems	319
Effects of plant strategies on productivity	322
Field observations and manipulations	323
Synthesis of ecosystems	326

CONTENTS	xi
Darwin, diversity and productivity	326
Experimental design and data interpretation: the current debate	329
The limitations of synthesised ecosystems	330
Effects of plant strategies on stability and sustainability	335
Resistance and resilience	335
Sustainability	345
References	349
Species list	404
Index	410
