1	Financial modelling beyond Brownian motion	1
1.1	Models in the light of empirical facts	5
1.2	Evidence from option markets	7
1.2.1	Implied volatility smiles and skews	8
1.2.2	Short-term options	10
1.3	Hedging and risk management	11
1.4	Objectives	13
I	Mathematical tools	17
2	Basic tools	19
2.1	Measure theory	20
2.1.1	σ -algebras and measures	20
2.1.2	Measures meet functions: integration	24
2.1.3	Absolute continuity and densities	25
2.2	Random variables	26
2.2.1	Random variables and probability spaces	26
2.2.2	What is $(\Omega, \mathcal{F}, \mathbb{P})$ anyway?	28
2.2.3	Characteristic functions	29
2.2.4	Moment generating function	31
2.2.5	Cumulant generating function	31
2.3	Convergence of random variables	32
2.3.1	Almost-sure convergence	32
2.3.2	Convergence in probability	34
2.3.3	Convergence in distribution	35
2.4	Stochastic processes	36
2.4.1	Stochastic processes as random functions	37
2.4.2	Filtrations and histories	39
2.4.3	Random times	40
2.4.4	Martingales	41
2.4.5	Predictable processes (*)	43
2.5	The Poisson process	44
2.5.1	Exponential random variables	44
2.5.2	The Poisson distribution	47
2.5.3	The Poisson process: definition and properties	48
2.5.4	Compensated Poisson processes	52
2.5.5	Counting processes	53

2.6	Random measures and point processes	55
2.6.1	Poisson random measures	57
2.6.2	Compensated Poisson random measure	59
2.6.3	Building jump processes from Poisson random measures	59
2.6.4	Marked point processes (*)	60
3	Lévy processes: definitions and properties	67
3.1	From random walks to Lévy processes	68
3.2	Compound Poisson processes	70
3.3	Jump measures of compound Poisson processes	75
3.4	Infinite activity Lévy processes	78
3.5	Pathwise properties of Lévy processes	85
3.6	Distributional properties	90
3.7	Stable laws and processes	92
3.8	Lévy processes as Markov processes	95
3.9	Lévy processes and martingales	97
4	Building Lévy processes	103
4.1	Model building with Lévy processes	103
4.1.1	“Jump-diffusions” vs. infinite activity Lévy processes	103
4.2	Building new Lévy processes from known ones	105
4.2.1	Linear transformations	105
4.2.2	Subordination	108
4.2.3	Tilting and tempering the Lévy measure	110
4.3	Models of jump-diffusion type	111
4.4	Building Lévy processes by Brownian subordination	113
4.4.1	General results	113
4.4.2	Subordinating processes	115
4.4.3	Models based on subordinated Brownian motion	116
4.5	Tempered stable process	119
4.6	Generalized hyperbolic model	123
5	Multidimensional models with jumps	131
5.1	Multivariate modelling via Brownian subordination	133
5.2	Building multivariate models from common Poisson shocks	135
5.3	Copulas for random variables	136
5.4	Dependence concepts for Lévy processes	143
5.5	Copulas for Lévy processes with positive jumps	145
5.6	Copulas for general Lévy processes	156
5.7	Building multivariate models using Lévy copulas	162
5.8	Summary	165
II	Simulation and estimation	169

6	Simulating Lévy processes	171
6.1	Simulation of compound Poisson processes	172
6.2	Exact simulation of increments	178
6.3	Approximation of an infinite activity Lévy process by a compound Poisson process	184
6.4	Approximation of small jumps by Brownian motion	188
6.5	Series representations of Lévy processes (*)	192
6.6	Simulation of multidimensional Lévy processes	199
7	Modelling financial time series with Lévy processes	207
7.1	Empirical properties of asset returns	209
7.2	Statistical estimation methods and their pitfalls	212
7.2.1	Maximum likelihood estimation	212
7.2.2	Generalized method of moments	217
7.2.3	Discussion	219
7.3	The distribution of returns: a tale of heavy tails	220
7.3.1	How heavy tailed is the distribution of returns?	221
7.4	Time aggregation and scaling	226
7.4.1	Self-similarity	226
7.4.2	Are financial returns self-similar?	230
7.5	Realized variance and “stochastic volatility”	232
7.6	Pathwise properties of price trajectories (*)	236
7.6.1	Hölder regularity and singularity spectra	237
7.6.2	Estimating singularity spectra	239
7.7	Summary: advantages and shortcomings of Lévy processes	241
III	Option pricing in models with jumps	245
8	Stochastic calculus for jump processes	247
8.1	Trading strategies and stochastic integrals	248
8.1.1	Semimartingales	253
8.1.2	Stochastic integrals for caglad processes	256
8.1.3	Stochastic integrals with respect to Brownian motion	257
8.1.4	Stochastic integrals with respect to Poisson random measures	259
8.2	Quadratic variation	263
8.2.1	Realized volatility and quadratic variation	263
8.2.2	Quadratic covariation	267
8.3	The Itô formula	269
8.3.1	Pathwise calculus for finite activity jump processes	270
8.3.2	Itô formula for diffusions with jumps	274
8.3.3	Itô formula for Lévy processes	275
8.3.4	Itô formula for semimartingales	279
8.4	Stochastic exponentials vs. ordinary exponentials	282
8.4.1	Exponential of a Lévy process	283

8.4.2	Stochastic (Doléans-Dade) exponential	284
8.4.3	Relation between ordinary and stochastic exponential	286
9	Measure transformations for Lévy processes	291
9.1	Pricing rules and martingale measures	293
9.1.1	Arbitrage-free pricing rules and martingale measures	296
9.2	Market completeness	299
9.3	Equivalence of measures for Lévy processes: simple cases	303
9.4	Equivalence of measures for Lévy processes: general results	307
9.5	The Esscher transform	310
9.6	Relative entropy for Lévy processes (*)	312
9.7	Summary	316
10	Pricing and hedging in incomplete markets	319
10.1	Merton's approach	321
10.2	Superhedging	324
10.3	Utility maximization	327
10.3.1	Certainty equivalent	327
10.3.2	Utility indifference price	328
10.3.3	The case of exponential utility	329
10.3.4	On the applicability of indifference pricing	330
10.4	Quadratic hedging	331
10.4.1	Mean-variance hedging: martingale case	331
10.4.2	Mean-variance hedging in exponential-Lévy models	333
10.4.3	Global vs. local risk minimization (*)	339
10.5	"Optimal" martingale measures	343
10.5.1	Minimal entropy martingale measure	343
10.5.2	Other martingale measures	346
10.6	Hedging with options and model calibration	346
10.7	Summary	348
11	Risk-neutral modelling with exponential Lévy processes	353
11.1	European options in exp-Lévy models	355
11.1.1	Call options	356
11.1.2	Implied volatility	357
11.1.3	Fourier transform methods for option pricing	361
11.2	Forward start options	367
11.3	Barrier options	368
11.4	American options	373
11.5	Multi-asset options	374

12	Integro-differential equations and numerical methods	381
12.1	Partial integro-differential equations for computing option prices	382
12.1.1	European options	384
12.1.2	Barrier options	389
12.1.3	American options	392
12.2	Second order integro-differential equations	394
12.2.1	Nonlocality and its consequences	396
12.2.2	The Fourier view: pseudo-differential operators	396
12.2.3	Classical solutions and Feynman-Kac representations	398
12.2.4	Viscosity solutions (*)	402
12.3	Trees and Markov chain methods	408
12.3.1	Multinomial trees	409
12.3.2	Multinomial trees as finite difference schemes	410
12.4	Finite difference methods: theory and implementation	411
12.4.1	Localization to a bounded domain	412
12.4.2	Discretization in space	414
12.4.3	An explicit-implicit finite difference method	415
12.4.4	Convergence	418
12.5	Analytic method of lines	421
12.6	Galerkin methods	422
12.6.1	Variational formulation and the Galerkin method	423
12.6.2	Choice of a basis	425
12.7	A comparison of numerical methods for PIDEs	427
13	Inverse problems and model calibration	431
13.1	Integrating prior views and option prices	434
13.2	Nonlinear least squares	436
13.3	Regularization using relative entropy	439
13.4	Numerical implementation	443
13.5	Numerical results	446
13.5.1	Tests on simulated data	447
13.5.2	Empirical result: single maturity	448
13.5.3	Empirical results: several maturities	448
IV	Beyond Lévy processes	451
14	Time inhomogeneous jump processes	453
14.1	Additive processes	454
14.2	Exponential additive models	460
14.2.1	Option pricing in risk-neutral exp-additive models	461
14.2.2	Calibration to option prices	463
14.3	Exp-additive models vs. local volatility models	465

15 Stochastic volatility models with jumps	469
15.1 Stochastic volatility models without jumps	471
15.1.1 Implied volatility smiles	473
15.1.2 The square root process	474
15.2 A stochastic volatility model with jumps: the Bates model	477
15.3 Non-Gaussian Ornstein-Uhlenbeck processes	480
15.3.1 Definition and properties	481
15.3.2 Stationary distributions of OU processes (*)	484
15.3.3 Positive Ornstein-Uhlenbeck processes	487
15.4 Ornstein-Uhlenbeck stochastic volatility models	488
15.5 Time changed Lévy processes	490
15.6 Do we need stochastic volatility and jumps?	494
A Modified Bessel functions	499
