Acknowledgement.....3

1 Summary 3

2 Author’s list of publications 6

2.1 Commentary to references 6

3 Introduction 7

3.1 Constituents of aortic wall 7

3.1.1 Elastin.....7

3.1.2 Collagen 7

3.1.3 Cells.....9

3.2 Aortic structure 10

3.2.1 Intima 10

3.2.2 Media.....11

3.2.3 Adventitia 12

3.3 Mechanical response of healthy aorta and its constitutive modeling 12

3.3.1 Fung model.....13

3.3.2 Holzapfel Gasser Ogden (HGO) model 13

3.3.3 Four fiber family model 14

3.3.4 Gasser model 14

3.3.5 Martufi-Gasser model 14

3.4 Effect of Ageing on the aortic structure 15

3.5 Abdominal aortic aneurysm (AAA) 15

3.5.1 Pathology of AAA.....17

3.5.2 Wall stress and AAA.....19

4 Commentaries to Author’s publications.....19

4.1 Summary of citations.....19

4.2	A numerical implementation to predict residual strains from the homogeneous stress hypothesis with application to abdominal aortic aneurysms.....	21
4.3	Importance of material model in wall stress prediction in abdominal aortic aneurysms	22
5	Automatic identification and validation of planar collagen organization in the aorta wall with application to abdominal aortic aneurysm	24
5.1	Structure-based constitutive model can accurately predict planar biaxial properties of aortic wall tissue.....	26
5.2	Biomechanical rupture risk assessment of abdominal aortic aneurysms based on a novel probabilistic rupture risk index	27
6	Automatic Evaluation of Collagen Fiber Directions from Polarized Light Microscopy Images	29
7	Assessing the potential risk of rupture of abdominal aortic aneurysms.....	31
7.1	Analysis of Accuracy of Biaxial Tests Based on their Computational Simulations	32
8	Conclusion.....	34
9	References:.....	35
