Contents

Preface ix

1 Setting the Scene 1
- 1.1 Structure of the book 1
- 1.2 Our limited use of mathematics 4
- 1.3 Variables 8
- 1.4 The geometry of multivariate analysis 10
- 1.5 Use of examples 11
- 1.6 Data inspection, transformations, and missing data 13
- 1.7 Reading 14

2 Cluster Analysis 17
- 2.1 Classification in social sciences 17
- 2.2 Some methods of cluster analysis 20
- 2.3 Graphical presentation of results 25
- 2.4 Derivation of the distance matrix 29
- 2.5 Example on English dialects 33
- 2.6 Comparisons 39
- 2.7 Clustering variables 41
- 2.8 Additional examples and further work 41
- 2.9 Further reading 53

3 Multidimensional Scaling 55
- 3.1 Introduction 55
- 3.2 Examples 57
- 3.3 Classical, ordinal, and metrical multidimensional scaling 61
- 3.4 Comments on computational procedures 64
- 3.5 Assessing fit and choosing the number of dimensions 65
- 3.6 A worked example: dimensions of colour vision 66
- 3.7 Additional examples and further work 68
- 3.8 Further reading 81

4 Correspondence Analysis 83
- 4.1 Aims of correspondence analysis 83
- 4.2 Carrying out a correspondence analysis: a simple numerical example 85

4.3 Carrying out a correspondence analysis: the general method 90
4.4 The biplot 93
4.5 Interpretation of dimensions 97
4.6 Choosing the number of dimensions 99
4.7 Example: confidence in purchasing from European Community countries 101
4.8 Correspondence analysis of multiway tables 107
4.9 Additional examples and further work 111
4.10 Further reading 116

5 Principal Components Analysis 117
5.1 Introduction 117
5.2 Some potential applications 118
5.3 Illustration of PCA for two variables 119
5.4 An outline of PCA 122
5.5 Examples 125
5.6 Component scores 131
5.7 The link between PCA and multidimensional scaling, and between PCA and correspondence analysis 134
5.8 Using principal component scores to replace the original variables 137
5.9 Additional examples and further work 138
5.10 Further reading 144

6 Regression Analysis 145
6.1 Basic ideas 145
6.2 Simple linear regression 147
6.3 A probability model for simple linear regression 150
6.4 Inference for the simple linear regression model 151
6.5 Checking the assumptions 153
6.6 Multiple regression 154
6.7 Examples of multiple regression 156
6.8 Estimation and inference about the parameters 157
6.9 Interpretation of the regression coefficients 159
6.10 Selection of regressor variables 161
6.11 Transformations and interactions 163
6.12 Logistic regression 165
6.13 Path analysis 168
6.14 Additional examples and further work 171
6.15 Further reading 174

7 Factor Analysis 175
7.1 Introduction to latent variable models 175
7.2 The linear single-factor model 178
7.3 The general linear factor model 180
7.4 Interpretation 184

7.5 Adequacy of the model and choice of the number of factors 186
7.6 Rotation 188
7.7 Factor scores 192
7.8 A worked example: the test anxiety inventory 194
7.9 How rotation helps interpretation 198
7.10 A comparison of factor analysis and principal components analysis 199
7.11 Additional examples and further work 201
7.12 Software 207
7.13 Further reading 207

8 Factor Analysis for Binary Data 209
8.1 Latent trait models 209
8.2 Why is the factor analysis model for metrical variables invalid for binary responses? 212
8.3 Factor model for binary data using the Item Response Theory approach 213
8.4 Goodness-of-fit 218
8.5 Factor scores 222
8.6 Rotation 224
8.7 Underlying variable approach 224
8.8 Example: sexual attitudes 226
8.9 Additional examples and further work 231
8.10 Software 240
8.11 Further reading 240

9 Factor Analysis for Ordered Categorical Variables 243
9.1 The practical background 243
9.2 Two approaches to modelling ordered categorical data 244
9.3 Item response function approach 245
9.4 Examples 252
9.5 The underlying variable approach 255
9.6 Unordered and partially ordered observed variables 260
9.7 Additional examples and further work 264
9.8 Software 270
9.9 Further reading 270

10 Latent Class Analysis for Binary Data 271
10.1 Introduction 271
10.2 The latent class model for binary data 272
10.3 Example: attitude to science and technology data 277
10.4 How can we distinguish the latent class model from the latent trait model? 281
10.5 Latent class analysis, cluster analysis, and latent profile analysis 283
10.6 Additional examples and further work 284

10.7 Software 288
10.8 Further reading 288

11 Confirmatory Factor Analysis and Structural Equation Models 289
11.1 Introduction 289
11.2 Path diagram 291
11.3 Measurement models 292
11.4 Adequacy of the model 298
11.5 Introduction to structural equation models with latent variables 301
11.6 The linear structural equation model 302
11.7 A worked example 312
11.8 Extensions 316
11.9 Additional examples and further work 317
11.10 Software 322
11.11 Further reading 323

12 Multilevel Modelling 325
12.1 Introduction 325
12.2 Some potential applications 326
12.3 Comparing groups using multilevel modelling 327
12.4 Random intercept model 333
12.5 Random slope model 335
12.6 Contextual effects 339
12.7 Multilevel multivariate regression 342
12.8 Multilevel factor analysis 348
12.9 Additional examples and further work 351
12.10 Further topics 353
12.11 Estimation procedures and software 354
12.12 Further reading 355
