

## Contents

<b>1. Introduction</b>	<b>7</b>
<b>2. Impacts and hits</b>	<b>9</b>
2.1 Introduction	9
2.2 Direct collision of mass points	10
2.3 Elastic impact	11
2.4 Inelastic impact	13
2.5 Partly elastic impact	13
2.6 Oblique impact	16
2.7 Forces at impacts – simplified solution	19
<b>3. Wave character of stress increase</b>	<b>23</b>
3.1 Longitudinal waves in a prismatic bar	23
3.2 Elastic waves in a bar hit by a body of finite size	27
3.3 Elastic waves in a three-dimensional body	27
3.4 Plastic waves	28
3.5 Hydraulic shock	29
<b>4. Courses of stopping for various resistances</b>	<b>31</b>
4.1 Braking with constant resistive force	31
4.2 Impact on a spring with linear characteristics	34
4.3 Impact on a spring with linear characteristics and friction damping	39
4.4 Impact on a spring with linear characteristics and damping proportional to velocity	41
4.5 Impact on a spring with linear characteristics and damping proportional to velocity squared	44
4.6 Changes of kinetic energy during braking	45
<b>5. Response and damage of materials and components</b>	<b>47</b>
5.1 Introduction	47
5.2 Elastic – plastic response of ductile materials	48
5.3 Load response of viscoelastic materials	51
5.4 Brittle and ductile failure	52
5.5 Ductile materials – elastic-plastic bending	54
5.6 Loss of stability by buckling	58

5.7	Influence of notches and other stress concentrators	60
5.8	Influence of cracks, principles of fracture mechanics	62
5.9	Failure of bodies from brittle materials	65
<b>6.</b>	<b>Structural elements for impact damping</b>	<b>73</b>
6.1	Rings and systems of rings	73
6.2	Zig-zag structures	76
6.3	Axisymmetric shells loaded by axial force	77
6.4	Materials with cellular structure	78
6.5	Axisymmetric tearing and inversion of metal tubes	80
6.6	Composites	82
6.7	Air- or gas bags and cushions	84
6.8	Hydraulic shock absorbers of constant force	86
<b>7.</b>	<b>Vibrations and mitigation of their effects</b>	<b>92</b>
7.1	Free vibration without damping	92
7.2	Free vibration with damping	94
7.3	Forced vibration	95
7.4	Forces transmitted from the vibrating body to the frame or foundations	101
7.5	Vibration caused by kinematic excitation	103
7.6	Transverse vibration of beams	105
7.7	Circular vibrations	107
7.8	Rotation of a shaft with eccentric load	108
7.9	Balancing of rotating objects	109
7.10	Energy in vibrating systems with damping	110
7.11	Dynamic absorber of vibrations	112
7.12	Vibration of systems with more degrees of freedom	114
<b>8.</b>	<b>Dimensional analysis and similarity theory</b>	<b>118</b>
8.1	Dimensional analysis	118
8.2	Similarity	120
8.3	Further recommendations	122
8.4	Limitations of similarity principle	124
8.5	Examples of dimensionless quantities	125
8.6	Examples of similarity numbers	126
