

Michael Rosen

Number Theory in Function Fields

Elementary number theory is concerned with arithmetic properties of the ring of integers. Early in the development of number theory, it was noticed that the ring of integers has many properties in common with the ring of polynomials over a finite field. The first part of this book illustrates this relationship by presenting, for example, analogues of the theorems of Fermat and Euler, Wilson's theorem, quadratic (and higher) reciprocity, the prime number theorem, and Dirichlet's theorem on primes in an arithmetic progression. After presenting the required foundational material on function fields, the later chapters explore the analogy between global function fields and algebraic number fields. A variety of topics are presented, including the ABC-conjecture, Artin's conjecture on primitive roots, the Brumer–Stark conjecture, Drinfeld modules, class number formulae, and average value theorems.

The first few chapters of this book are accessible to advanced undergraduates. The later chapters are designed for graduate students and professionals in mathematics and related fields who want to learn more about the very fruitful relationship between number theory in algebraic number fields and algebraic function fields. In this book many paths are set forth for future learning and exploration.

Michael Rosen is Professor of Mathematics at Brown University, where he has been since 1962. He has published over 40 research papers, and he is the coauthor of *A Classical Introduction to Modern Number Theory*, with Kenneth Ireland. He received the Chauvenet Prize of the Mathematical Association of America in 1999 and the Philip J. Bray Teaching Award of Brown University in 2001.

Preface	vii
1 Polynomials over Finite Fields	1
Exercises	7
2 Primes, Arithmetic Functions, and the Zeta Function	11
Exercises	19
3 The Reciprocity Law	23
Exercises	30
4 Dirichlet L-Series and Primes in an Arithmetic Progression	33
Exercises	43
5 Algebraic Function Fields and Global Function Fields	45
Exercises	59
6 Weil Differentials and the Canonical Class	63
Exercises	75
7 Extensions of Function Fields, Riemann-Hurwitz, and the ABC Theorem	77
Exercises	98

8	Constant Field Extensions	101
	Exercises	112
9	Galois Extensions - Hecke and Artin L-Series	115
	Exercises	145
10	Artin's Primitive Root Conjecture	149
	Exercises	166
11	The Behavior of the Class Group in Constant Field Extensions	169
	Exercises	190
12	Cyclotomic Function Fields	193
	Exercises	216
13	Drinfeld Modules: An Introduction	219
	Exercises	239
14	S -Units, S -Class Group, and the Corresponding L-Functions	241
	Exercises	256
15	The Brumer-Stark Conjecture	257
	Exercises	278
16	The Class Number Formulas in Quadratic and Cyclotomic Function Fields	283
	Exercises	302
17	Average Value Theorems in Function Fields	305
	Exercises	326
	Appendix: A Proof of the Function Field Riemann Hypothesis	329
	Bibliography	341
	Author Index	353
	Subject Index	355
