Preface to the Second Edition

1 Introduction

- 1.1 The challenge
- 1.2 Discovery status
- 1.3 Outline of the treatment
 - 1.3.1 Observational techniques
 - 1.3.2 Host star properties and brown dwarfs
 - 1.3.3 Theoretical considerations
 - 1.3.4 Solar system
 - 1.3.5 Appendixes
 - 1.3.6 Hyperlinks and online resources
- 1.4 Astronomical terms and units
- 1.5 Definition of a planet
- 1.6 Planet categories
 - 1.6.1 Classification by size or mass
 - 1.6.2 Giant planets
 - 1.6.3 Earths and super-Earths
- 1.7 On-line reference compilations
- 1.8 Future developments

2 Radial velocities

- 2.1 Orbits and orbit fitting
 - 2.1.1 Description of orbits
 - 2.1.2 Orbits from radial velocities
 - 2.1.3 Single planet fitting
 - 2.1.4 Multiple planet fitting
 - 2.1.5 Bayesian methods
 - 2.1.6 Algorithmic implementation
 - 2.1.7 Detectability and selection effects
 - 2.1.8 Scheduling
- 2.2 Measurement principles
 - 2.2.1 Doppler shifts
 - 2.2.2 Spectral resolution
 - 2.2.3 Cross-correlation spectroscopy
 - 2.2.4 Determination of barycentric velocities
- 2.3 Wavelength calibration
 - 2.3.1 Telluric lines
 - 2.3.2 Gas cells
 - 2.3.3 Emission lamps

31

32

2.3.4	Infrared calibration	32
2.3.5	Laser frequency combs	32
2.3.6	Fabry–Pérot étalons	33
2.3.7	Radial velocity standards	33
2.3.8	Fiber coupling	34
2.4	Accuracy limits and error sources	34
2.4.1	Photon noise	35
2.4.2	Detection versus signal-to-noise	35
2.4.3	Exposure metering	35
2.4.4	Instrument errors	35
2.4.5	Stellar activity	36
2.4.6	Excluding other sources of periodicity	38
2.4.7	Bisector analysis	39
2.5	Higher-order radial velocity effects	40
2.5.1	Gravitational redshift variations	40
2.5.2	Zeeman effect	40
2.5.3	Planet-induced tides	41
2.5.4	Planet radial velocity signals	41
2.5.5	Determination of inclination	44
2.6	Radial velocity instruments	45
2.6.1	Overview	45
2.6.2	State-of-the-art in échelle spectroscopy	45
2.6.3	Other optical spectrographs	47
2.6.4	Infrared spectrographs	47
2.6.5	Optical–infrared spectrographs	48
2.6.6	Future instrument plans	49
2.6.7	Externally dispersed interferometry	49
2.6.8	Absolute accelerometry	50
2.7	Introduction to the radial velocity results	50
2.7.1	The first radial velocity exoplanets	50
2.7.2	Example radial velocity curves	51
2.7.3	Present radial velocity census	51
2.7.4	Reviews	53
2.7.5	On-line compilations	53
2.8	Surveys according to stellar type	53
2.8.1	Main sequence stars	53
2.8.2	Early-type dwarfs	54
2.8.3	Evolved stars: subgiants and giants	56
2.8.4	M dwarfs	57
2.9	Surveys according to other criteria	59
2.9.1	Nearby stars and volume-limited samples	59
2.9.2	Specific nearby stars	59
2.9.3	Solar twins and Jupiter analogues	59
2.9.4	Effects of metallicity	60
2.9.5	Open clusters	61
2.9.6	Young stars and associations	61
2.9.7	Follow-up of transit candidates	61
2.10	Masses and orbits	62
2.10.1	Mass distribution	62
2.10.2	Mass of host star	62
2.10.3	Period distribution	62
2.10.4	Eccentricities	63
2.10.5	Brown dwarf desert	64
2.11	Results according to planet type	66
2.11.1	Low-mass planets	66

2.11.2	Super-Earths and Neptunes	66
2.11.3	High-mass planets	66
2.11.4	Hot Jupiters	67
2.12	Multi-planet systems	67
2.12.1	General considerations	67
2.12.2	Architectures and classification	68
2.12.3	Systems with three or more giant planets	68
2.12.4	Systems in mean motion resonance	71
2.12.5	Interacting two-planet systems	77
2.12.6	Non-interacting two-planet systems	77
2.12.7	Super-Earth systems	77
2.13	Binary and multiple stars	78
2.13.1	Present inventory	79
2.13.2	Specific examples	80
3	Astrometry	81
3.1	Introduction	81
3.2	Astrometric accuracy from ground	82
3.2.1	Single aperture	82
3.2.2	Interferometry	83
3.3	Microarcsec astrometry	84
3.3.1	Light deflection	84
3.3.2	Aberration	85
3.3.3	Source motion	85
3.3.4	Astrophysical limits	85
3.4	Modeling planetary systems	86
3.4.1	Proper motion and parallax	86
3.4.2	Multiple planets	86
3.4.3	Keplerian elements	87
3.4.4	Mass and orbit inclination	88
3.4.5	Planet–planet interactions	88
3.4.6	Wavelength dependence	89
3.4.7	Coordinate transformations	89
3.5	Astrometric searches from the ground	90
3.5.1	Single mirror	90
3.5.2	Discoveries and candidates	91
3.5.3	Optical interferometry	91
3.6	Astrometry from space: principles	91
3.7	Astrometry from space: HST	92
3.8	Astrometry from space: Hipparcos	93
3.9	Astrometry from space: Gaia	95
3.9.1	Principles	95
3.9.2	Expected astrometric planet yield	96
3.9.3	Transiting planets from Gaia astrometry	99
3.9.4	Data releases	99
3.10	Other space astrometry projects	99
3.10.1	Proposed space missions	99
3.10.2	Projects no longer under consideration	100
3.11	Radio and sub-mm astrometry	100
3.11.1	Astrometry at radio wavelengths	100
3.11.2	Astrometry at mm/sub-mm wavelengths	101
4	Timing	103
4.1	Candidates and time scales	103
4.2	Pulsars	103

4.2.1	Characteristics	103
4.2.2	Individual pulsars	105
4.2.3	Other considerations	109
4.3	Pulsating stars	110
4.3.1	Context	110
4.3.2	White dwarfs	110
4.3.3	Rapidly pulsating subdwarfs	111
4.4	Eclipsing binaries	112
4.4.1	Context	112
4.4.2	Candidate systems	113
4.4.3	Complicating factors	113
4.4.4	Individual systems	114
4.5	Transit timing variations	117
5	Microlensing	119
5.1	Introduction	119
5.2	Principles	120
5.2.1	Light bending	120
5.2.2	Magnification	122
5.2.3	Optical depth and event rate	123
5.3	Light curves	124
5.3.1	Single lens characterisation	124
5.3.2	Binary lens characterisation	124
5.3.3	Multiple point mass lenses	125
5.3.4	Critical curves, caustics, and cusps	126
5.3.5	Binary lens caustics	126
5.3.6	Magnification maps	127
5.3.7	High-magnification events	128
5.3.8	Short-duration events	129
5.3.9	Repeating events	129
5.3.10	Binary lens, binary source	129
5.3.11	Free-floating objects	129
5.3.12	Planets orbiting a binary system	130
5.4	Light curve modeling	130
5.4.1	Ray shooting	130
5.4.2	Model fitting	131
5.4.3	Lens–source transverse motion	131
5.5	Higher-order effects	131
5.5.1	Blending	131
5.5.2	Finite source size	131
5.5.3	Limb darkening of the source	132
5.5.4	Orbital motion	132
5.5.5	Parallax and lens mass	133
5.5.6	High-resolution imaging	135
5.6	Potentially observable effects	135
5.6.1	Structure in the lens	135
5.6.2	Structure in the source	136
5.6.3	Physical effects	136
5.6.4	Transiting planets	137
5.6.5	Specific targets	137
5.7	Solar system lensing	137
5.8	Astrometric microlensing	138
5.9	Observations	139
5.9.1	Ground-based: first generation (pre–2010)	139
5.9.2	Ground-based: second generation (post–2010)	141

5.9.3	Ground-based: other	142
5.9.4	Space-based: ongoing	143
5.9.5	Space-based: future	143
5.10	Results	143
5.10.1	Individual objects	143
5.10.2	Statistical results	144
5.10.3	Limitations and strengths	151
6	Transits	153
6.1	Introduction	153
6.2	Transit searches: wide angle	155
6.3	Transit searches: specific targets	157
6.3.1	Radial velocity discoveries	157
6.3.2	Open and globular clusters	158
6.3.3	Circumbinary planets	159
6.3.4	Specific spectral types	160
6.3.5	Solar system transit observations	161
6.4	Surveys from the ground	162
6.4.1	HAT/HATNet	162
6.4.2	WASP/SuperWASP	164
6.4.3	Other searches reporting detected planets	165
6.4.4	Other ground-based surveys	169
6.5	Searches from space: CoRoT	171
6.6	Searches from space: Kepler	174
6.6.1	Instrument details	174
6.6.2	Target stars and accuracies	175
6.6.3	K2 mission extension	176
6.6.4	Future follow-up for Kepler and K2	177
6.6.5	Synopsis of results	178
6.6.6	Contributions to other fields	178
6.7	Other planet discoveries from space	178
6.8	Future observations from space	178
6.8.1	Approved surveys: dedicated	180
6.8.2	Approved surveys: by-products	180
6.8.3	Future follow-up from space: approved	181
6.8.4	Future follow-up from space: candidates	182
6.9	Follow-up observations from the ground	182
6.9.1	Transit photometry	182
6.9.2	High time resolution	182
6.9.3	Interferometric observations	183
6.9.4	Follow-up from ground: networks	183
6.10	Follow-up observations from space	184
6.10.1	EPOXI-EPOCH	184
6.10.2	Hubble Space Telescope	184
6.10.3	Hipparcos	185
6.10.4	MOST	186
6.10.5	Spitzer Space Telescope	186
6.10.6	Others	187
6.11	Accuracy: photometric and timing	187
6.11.1	Stellar activity	187
6.11.2	Photometry from the ground	188
6.11.3	Defocused transits	189
6.11.4	Beam-shaping diffusers	189
6.11.5	Conjugate-plane photometry	189
6.11.6	Timing accuracy	189

6.12	Transit detection and light curve analysis	190
6.12.1	Detrending	190
6.12.2	Transit detection	190
6.12.3	Kepler special cases	191
6.12.4	Light curve fitting	195
6.12.5	Candidate confirmation	196
6.13	Transit light curves	199
6.13.1	Principal transit observables	199
6.13.2	Geometric formulation	200
6.13.3	Light curve fitting	202
6.13.4	Biases	202
6.13.5	Circular orbits	202
6.13.6	Eccentric orbits	203
6.13.7	Physical quantities	205
6.13.8	Doppler variability	206
6.13.9	Secondary eclipse	207
6.13.10	Planet mass determination	207
6.13.11	Asterodensity profiling	207
6.14	Higher-order photometric effects	210
6.14.1	Limb darkening	211
6.14.2	Star spots	211
6.14.3	Stellar rotation and gravity darkening	215
6.14.4	Binary planets	216
6.14.5	Exoplanetary rings	217
6.14.6	Debris and transition disks	218
6.14.7	Planetary oblateness due to rotation	219
6.14.8	Atmospheric and topographic features	221
6.14.9	Night-side emission	221
6.14.10	Early ultraviolet ingress and bow shocks	221
6.14.11	Refraction and stellar mirages	222
6.14.12	Microlensing amplification	223
6.14.13	Variability-induced motion	223
6.14.14	Grazing transits	223
6.14.15	Hill sphere transits	224
6.14.16	Planet–planet eclipses	225
6.14.17	Tidal effects	226
6.14.18	Planetary prolateness under tidal locking	226
6.14.19	Tidally-induced gravity darkening	229
6.14.20	Tidally-excited stellar oscillations	230
6.14.21	Tidal disruption	230
6.14.22	Disintegrating planets and dusty tails	231
6.14.23	Artificial bodies and other civilisations	233
6.14.24	Transits across white dwarfs	233
6.15	Orbital phase curves	233
6.15.1	Reflected light	234
6.15.2	Glint	237
6.15.3	Beaming, ellipsoidal, and reflection effects	238
6.15.4	Doppler beaming	238
6.15.5	Ellipsoidal variations	239
6.15.6	Collective modeling	240
6.15.7	Atmospheric effects	242
6.15.8	Spin–orbit tomography	242
6.15.9	Multi-planet systems	243
6.15.10	Algorithmic implementation	243
6.16	Transits at other wavelengths	243

6.16.1	X-ray	243
6.16.2	Sub-mm and radio	244
6.17	Polarisation	244
6.17.1	Transit effects	244
6.17.2	Scattered light	246
6.18	Rossiter–McLaughlin effect	248
6.18.1	Context	248
6.18.2	Formalism	248
6.18.3	Higher-order effects	250
6.18.4	Transit of Venus	251
6.18.5	Rossiter–McLaughlin at secondary eclipse	251
6.18.6	Line-profile (Doppler) tomography	251
6.18.7	Results	252
6.18.8	Implications for migration models	255
6.19	Secular timing effects	256
6.19.1	Parallax and space motion	256
6.19.2	Distant stellar or planetary companions	257
6.19.3	General relativistic effects	257
6.19.4	Apsidal precession	257
6.19.5	Nodal precession	259
6.19.6	Tidal decay	260
6.19.7	Other time-dependent effects	260
6.19.8	Transitional transits	261
6.20	Transit timing variations	262
6.20.1	General considerations	262
6.20.2	Classification of configurations	263
6.20.3	Other treatments of perturbed systems	265
6.20.4	Orbits and masses	266
6.20.5	Observations from the ground	269
6.20.6	Contributions from Kepler	269
6.20.7	Non-transiting planets	272
6.20.8	Absence of transit timing variations	272
6.20.9	Effect on transit search algorithms	272
6.20.10	Transit duration variations	272
6.21	Trojans	273
6.21.1	Detection from transit timing variations	274
6.21.2	Detection from photometric signatures	274
6.22	Exomoons	275
6.22.1	Detection methods	276
6.22.2	Photo-dynamical treatment	279
6.22.3	Sense of orbital motion	280
6.22.4	Other considerations	281
6.22.5	Searches and candidates	281
6.23	Exocomets	282
6.24	Transit and eclipse spectroscopy	283
6.24.1	Principles	283
6.24.2	Equilibrium temperature and albedo	285
6.24.3	Observations	287
6.25	Range of properties of transiting planets	287
6.26	Kepler distributions and occurrence rates	288
6.26.1	Size and period distributions	288
6.26.2	Eccentricities	289
6.26.3	Occurrence rates	289
6.27	Mass, radius, and composition	291
6.27.1	Small-radii Kepler planets	294

6.27.2	Low-mass gaseous Kepler planets	296
6.27.3	Mass and radius estimation	297
6.27.4	Minimum densities from the Roche radius	298
6.27.5	Effects of photoevaporation	298
6.28	Transiting hot Jupiters	299
6.28.1	Introduction	299
6.28.2	Secondary eclipses	300
6.28.3	Albedos	301
6.28.4	Anomalous (inflated) radii	302
6.28.5	Companion planets	304
6.28.6	Stellar companions	305
6.28.7	Satellites	305
6.28.8	Stellar activity and planet surface gravity	305
6.28.9	Other properties	306
6.29	Host stars	307
6.29.1	Stellar radii	307
6.29.2	Stellar densities	307
6.29.3	Metallicity dependence	308
6.29.4	Mass dependence	308
6.29.5	Rotation and gyrochronology	309
6.29.6	Stellar obliquities	311
6.29.7	Asteroseismology	311
6.29.8	Stellar binarity/multiplicity	313
6.30	Multiple planet systems	313
6.30.1	Overview of Kepler results	313
6.30.2	Hill stability	315
6.30.3	Dynamical stability	316
6.30.4	Resonances in the Kepler systems	318
6.30.5	Mutual inclinations of multi-planet systems	322
6.30.6	The Kepler dichotomy	324
6.31	Circumbinary planets	325
7	Imaging	329
7.1	Introduction	329
7.2	Active optics	331
7.3	Atmospheric effects	331
7.3.1	Adaptive optics	331
7.3.2	Speckle and lucky imaging	332
7.4	Coronagraphic masks	333
7.4.1	Introduction	333
7.4.2	Classification of concepts	334
7.4.3	Discovery space	338
7.4.4	Other considerations	338
7.4.5	Speckle noise	339
7.5	Other considerations	341
7.5.1	Integral field spectroscopy	341
7.5.2	Astrometric orbits	341
7.5.3	Exozodiacal dust	342
7.6	Ground-based imaging instruments	342
7.6.1	First-generation instruments	343
7.6.2	Second-generation instruments	343
7.6.3	Extremely large telescopes	345
7.6.4	Imaging from the Antarctic	347
7.6.5	Interferometry	348
7.7	Space-based imaging instruments	349

7.7.1	Existing space telescopes	349
7.7.2	Future space telescopes	350
7.7.3	Concepts for future space imaging missions	350
7.8	Other imaging concepts	353
7.8.1	Medium-term prospects	353
7.8.2	Future prospects: resolved imaging	354
7.8.3	Planetary radar	355
7.8.4	Gravitational wave signatures	356
7.8.5	Sub-diffraction limit imaging	356
7.8.6	Desirable innovations	357
7.9	Searches and surveys	357
7.9.1	Searches with first-generation instruments	358
7.9.2	Searches with second-generation instruments	359
7.9.3	Searches around exoplanet host stars	360
7.9.4	Searches around binary stars	361
7.10	Discoveries	361
7.10.1	Planets around nearby stars	363
7.10.2	Planets within debris disks	364
7.10.3	Disks with spiral arms	367
7.11	Miscellaneous signatures	368
7.11.1	Planetary and protoplanet collisions	368
7.11.2	Accretion onto the central star	368
7.12	Imaging at other wavelengths	370
7.12.1	X-ray and radio wavelengths	370
7.12.2	Sub-mm and mm wavelengths	370
8	Host stars	373
8.1	Knowledge from astrometry	373
8.1.1	Hipparcos distances and proper motions	373
8.1.2	Gaia	373
8.1.3	Nearby star census	374
8.2	Physical properties	376
8.2.1	Absolute magnitude	376
8.2.2	Effective temperature	377
8.2.3	Parameters from spectroscopy	377
8.2.4	Stellar diameters	378
8.2.5	Masses and radii	378
8.2.6	Stellar ages	379
8.3	Stellar rotation	381
8.3.1	Diagnostics of rotation	382
8.3.2	Obliquities	384
8.3.3	Differential rotation	385
8.3.4	Angular momentum	386
8.3.5	Magnetic fields	387
8.4	Element abundances	388
8.4.1	Metallicity	388
8.4.2	Occurrence versus metallicity	389
8.4.3	Origin of the metallicity difference	392
8.4.4	Refractory and volatile elements	396
8.4.5	The r- and s-process elements	399
8.4.6	The alpha elements	399
8.4.7	Lithium	400
8.4.8	Beryllium	403
8.5	Occurrence versus stellar type	403
8.5.1	M dwarfs	404

8.5.2	Solar twins, analogues, and siblings	405
8.5.3	Other stellar classes	406
8.6	Asteroseismology	406
8.6.1	Principles	406
8.6.2	Application to CoRoT and Kepler targets	409
8.6.3	Application to exoplanet host stars	409
8.6.4	Planet and exoplanet seismology	411
8.7	Stellar variability	411
8.8	Stellar multiplicity	412
8.9	White dwarfs	412
8.9.1	Survival considerations	412
8.9.2	Imaging	414
8.9.3	Dust disks	415
8.9.4	Elemental pollution	416
8.9.5	Evidence for differentiation	419
8.10	Star-planet interactions	420
8.10.1	Overview of the various interactions	420
8.10.2	Magnetic and chromospheric activity	420
8.10.3	Stellar winds	422
8.10.4	X-ray emission	422
