PART 1 Working with DNA and RNA

1	Gene cloning essentials	3
1.1	Introduction	4
1.2	Gene cloning applications	4
1.3	Gene cloning in the laboratory	5
1.4	Gene cloning processes	14
1.5	Further types of gene cloning	18
1.6	Chapter summary	21
2	Polymerase chain reaction	23
2.1	Introduction	23
2.2	How PCR works	24
2.3	The PCR protocol	26
2.4	PCR techniques and applications	31
2.5	Forensic DNA analysis	40
2.6	Future prospects	41
2.7	Chapter summary	41
3	DNA mutagenesis	44
3.1	Introduction	45
3.2	Rational or site-directed mutagenesis	45
3.3	Uracil-containing DNA	47
3.4	QuikChange® mutagenesis	47
3.5	Multi-site mutagenesis	52
3.6	Cassette mutagenesis	54
3.7	PCR mutagenesis	56
3.8	Saturation mutagenesis	58

3.9	Random mutagenesis	60
3.10	Chapter summary	61
4	DNA sequencing	66
4.1	First-generation sequencing	67
4.2	Next-generation sequencing	77
4.3	Third-generation sequencing	85
4.4	Chapter summary	86
5	Measuring DNA–protein interactions	88
5.1	Introduction	89
5.2	Footprinting	91
5.3	Electrophoretic mobility shift assay (EMSA)	97
5.4	Chromatin immunoprecipitation	103
5.5	Chapter summary	112
6	RNA interference technology	116
6.1	Regulation of gene expression: the RNA interference pathway	117
6.2	Applications of RNAi	119
6.3	Short interfering RNA (siRNA)	122
6.4	Short hairpin RNA (shRNA)	127
6.5	Targeted gene silencing: therapeutic possibilities	136
6.6	Chapter summary	139
PART 2 Working with protein		
7	Recombinant protein expression	145
7.1	Introduction	146
7.2	Choosing the right expression system	148
7.3	<i>E. coli</i> -based expression systems	151
7.4	Yeast expression systems	157
7.5	Baculovirus–insect larval cell expression system	167
7.6	Chapter summary	171
8	Protein purification	175
8.1	Introduction	175
8.2	Devising a purification strategy	176
8.3	Cell lysis and disruption	181
8.4	Performing chromatography	183
8.5	Chromatographic separation methods	184

8.6	Measuring protein recovery	192
8.7	Chapter summary	194
9	Antibodies as research tools	196
9.1	Introduction	196
9.2	Antibody structure and function	197
9.3	Target detection and visualization	200
9.4	Do I need to make a new antibody?	202
9.5	Common experimental platforms for immunoassay	209
9.6	Chapter summary	215
10	Measuring protein–protein interactions: qualitative approaches	218
10.1	Introduction	218
10.2	Pull-down methods	219
10.3	Phage display for analysis of protein interactions	223
10.4	Yeast two-hybrid assay	229
10.5	Chapter summary	233
11	Measuring protein–protein interactions: quantitative approaches	237
11.1	Introduction	237
11.2	Fluorescence spectroscopy	238
11.3	Isothermal titration microcalorimetry	246
11.4	Surface plasmon resonance	252
11.5	Chapter summary	258
12	Structural analysis of proteins: X-ray crystallography, NMR, AFM, and CD spectroscopy	261
12.1	X-ray crystallography	262
12.2	Nuclear magnetic resonance	269
12.3	Atomic force microscopy	276
12.4	Circular dichroism spectroscopy	286
12.5	Chapter summary	291
13	Mass spectrometry	295
13.1	Introduction	296
13.2	Sample preparation and ionization	298
13.3	Mass analysis	306
13.4	Tandem mass spectrometry	310
13.5	Chapter summary	313

14	Proteomic analysis	318
14.1	Introduction	318
14.2	Gel-based proteomics	320
14.3	Protein identification by tandem mass spectrometry (MS/MS)	322
14.4	Post-translational modifications	324
14.5	Quantitative mass spectrometry	327
14.6	Data analysis	338
14.7	Chapter summary	339

PART 3 Working with cells and tissues

15	Culturing mammalian cells	343
15.1	Introduction	344
15.2	Culturing cells <i>in vitro</i> : essential principles	345
15.3	General applications	351
15.4	Human embryonic and adult stem cells: culture, isolation, and expansion	351
15.5	Stem cell culture protocols	355
15.6	Limitations of cell culturing methods	360
15.7	Ethical and storage issues	364
15.8	Chapter summary	364

16	Flow cytometry	368
16.1	Flow cytometers: how they work	369
16.2	Data display and analysis	373
16.3	Flow cytometry application: immunophenotyping	378
16.4	Flow cytometry application: cell cycle analysis	382
16.5	Flow cytometry application: apoptosis and viability assessment	383
16.6	Cell sorting	387
16.7	Chapter summary	392

17	Bioimaging: light and electron microscopy	394
17.1	Fluorescence microscopy	395
17.2	Transmission electron microscopy	405
17.3	Correlative light electron microscopy	413
17.4	Chapter summary	415

18	Histopathology in biomolecular research	418
18.1	Introduction	419
18.2	Ethical approval and consent	420
18.3	Tissue organization and data storage	420

18.4	Obtaining tissue samples for research	420
18.5	Recognizing pathology	422
18.6	Tissue preparation	425
18.7	Microscopic analysis of tissue samples	428
18.8	Chapter summary	436

PART 4 Working with models in the biomolecular sciences

19	Mouse models in bioscience research	441
19.1	Introduction	441
19.2	Transgenic mice	443
19.3	Gene targeted mice	449
19.4	Regulatable gene expression systems (Cre- <i>lox</i> models)	455
19.5	Regulatable gene expression systems (Tet-Off/Tet-On mice)	459
19.6	Chapter summary	462
20	Mathematical models in biomolecular sciences	466
20.1	Introduction	466
20.2	Difference equations	469
20.3	Cellular automata	472
20.4	Networks	474
20.5	Markov chains	476
20.6	Petri nets	477
20.7	Ordinary differential equations (ODEs)	478
20.8	Chapter summary	480
	<i>Glossary</i>	484
	<i>Index</i>	504
