Preface	v
Contents	vii
I Theoretical background	1
1 Introduction to Financial Markets	5
1.1 Typology of financial markets	6
1.2 Participants	6
1.3 Financial securities	8
1.4 Margins	10
1.5 Basic valuation principles	10
1.6 Stochastic processes	14
1.7 Discrete-time models	20
2 Financial Derivatives	27
2.1 Forwards	28
2.2 Futures	33
2.3 Options	33
3 Black and Scholes model	39
3.1 Derivation of the model	40
3.2 BS formula	41
3.3 Initial-boundary value problem	42
3.4 Variational formulation	43
3.5 Sensitivity measurement	45

II	Standard Numerical Methods	47
4	Binomial model	51
4.1	CRR – single-period model	52
4.2	CRR – multi-period model	55
4.3	Trinomial model	57
4.4	Model with variable parameters	59
4.5	Convergence to continuous-time models	61
5	Finite difference methods	65
5.1	FDM	66
5.2	Implicit FDM	66
5.3	Explicit FDM	68
5.4	Change of the variables	71
5.5	Alternative FDM	71
III	Novel Numerical Approaches	73
6	Discontinuous Galerkin method	79
6.1	Partition and function spaces	79
6.2	Derivation of DG formulation for BS problem	82
6.3	Time discretization	85
6.4	Numerical scheme	86
6.5	Approximate evaluation of Greeks	87
7	Wavelet method	89
7.1	Semi-discretization in time	89
7.2	Properties of wavelet basis	91
7.3	Construction of linear spline wavelet basis	92
7.4	Construction of quadratic spline wavelet basis	94
7.5	Adaptive wavelet method	95

8	Fuzzy transform method	103
8.1	Fuzzy partition	103
8.2	Fuzzy transform	106
8.3	Numerical scheme based on F-transform	107
8.4	Approximate evaluation of Greeks	111
IV	Empirical application	113
9	Empirical comparison	115
9.1	Parameter settings	115
9.2	Option prices	116
9.3	Sensitivity measures	120
	Conclusion	127
	List of Figures	129
	List of Tables	131
	References	133
	Index	141
	Summary	143
