Preface .....	i
<b>1. Basic Concepts in Banach Spaces</b> .....	<b>1</b>
Banach spaces, subspaces, quotient spaces, Hölder and Minkowski inequalities, classical spaces $c_0$ , $\ell_p$ , $L_p[0, 1]$ , $C[0, 1]$ , finite-dimensional subspaces, Hilbert spaces, Riesz' lemma, separability, orthonormal bases in Hilbert spaces. In Exercises: Geometric and topological properties of Banach and Hilbert spaces, unconditional convergence.	
<b>2. Hahn-Banach Theorem, Dual Space</b> .....	<b>27</b>
The Hahn-Banach theorem, dual space, dual operators, elementary Riesz' representation of duals to $c_0$ , $\ell_p$ , $L_p[0, 1]$ and $C[0, 1]$ . In Exercises: Examples on duality, convexity and separation, the Banach limit.	
<b>3. Weak Topologies, More on the Structure of Banach Spaces</b> .....	<b>41</b>
Weak topology, weak star topology, second dual, bounded sets, Banach-Steinhaus theorems, Alaoglu's theorem, Goldstine's theorem, reflexivity, extreme points, the Krein-Milman theorem, James-Simons-Godefroy theorems on James boundaries of sets, James' characterization of weak compactness, the Eberlein-Šmulyan and Krein-Šmulyan theorems in separable spaces. In Exercises: Geometric and topological properties of the weak and weak star topologies, extremal structure of convex sets, more on James' results on weak compactness, sliding hump technique, dual spaces, separation.	
<b>4. Open Mapping Theorem, More on Classical Spaces</b> .....	<b>67</b>
Banach's open mapping and closed graph theorems, projections and complementability, Auerbach bases, Sobczyk's theorem on complementability of $c_0$ in separable overspaces, Phillips' theorem on non-complementability of $c_0$ in $\ell_\infty$ , every separable Banach space is isometric to a subspace of $C[0, 1]$ , every separable Banach space is isomorphic to a quotient of $\ell_1$ , Schur's theorem on the coincidence of weak and norm convergence of sequences in $\ell_1$ . In Exercises: subspaces, complementability, hyperplanes, projections, isomorphisms, isometries, operators with closed range, bilinear forms.	
<b>5. Differentiability of Norms and Duality</b> .....	<b>91</b>
Gâteaux and Fréchet differentiability of norms, Šmulyan's dual test, Kadets's renorming of spaces with separable dual by Fréchet differentiable norms, the Asplund-Lindenstrauss result on Fréchet differentiability on dense set of convex functions on spaces with separable dual, Mazur's theorem, Lindenstrauss' results on strongly exposed points of weakly compact sets. In Exercises: Differentiability of convex functions and extremal structure of convex sets in classical spaces, rotundity, Kadets-Klee property, Fenchel duality, Mazur's intersection property, strong subdifferentiability.	
<b>6. Compact Operators on Banach Spaces</b> .....	<b>119</b>
Finite rank and compact operators, spectrum and resolvent, self-adjoint operators on Hilbert spaces, spectral radius, spectral theory of compact self-adjoint operators on Hilbert spaces, normal operators, the Fredholm alternative, Fredholm operators, examples of integral operators. In Exercises: Examples on spectra, completely continuous and Hilbert-Schmidt operators, Lomonosov's theorem on invariant subspaces, some properties of $\mathcal{K}(\ell_2)$ and $\mathcal{B}(\ell_2)$ .	
<b>7. Fixed Point Property</b> .....	<b>149</b>
The Markov-Kakutani theorem, Banach's contraction principle, non-expansive mappings in Hilbert spaces, Schauder's theorems, applications to differential equations. In Exercises: Examples of fixed points, Alspach's fixed-point-free isometry on a weakly compact set, Werner's proof of the Markov-Kakutani theorem.	

## Table of Contents

<b>8. Locally Convex Spaces</b> .....	<b>159</b>
The notion of a locally convex space, metrizability, normability, finite dimensionality, separation, the bipolar theorem, the Mackey-Arens-Katětov theorem, the space of distributions, Choquet's representation theorem in metrizable case, the Banach-Dieudonné theorem, the Eberlein-Šmul'yan theorem, Kaplansky's theorem on countable tightness of the weak topology of a Banach space, the Banach-Stone theorem. In Exercises: Examples, the Banach-Stone theorem, Sobolev spaces, Grothendieck-Pták results.	
<b>9. Schauder Bases</b> .....	<b>185</b>
The notion of a Schauder basis, shrinking and boundedly complete bases, James' theorems on the characterization of reflexivity in terms of bases, Mazur's basic sequence theorem, the Krein-Milman-Rutman stability result, Pelczyński's theorems on subspaces of $\ell_p$ spaces, unconditional Schauder bases, James' theorem on containment of $\ell_1$ and $c_0$ , Pitt's theorem, James' space $J$ , Khintchine's inequality, Rademacher functions in $L_p$ . In Exercises: Examples of Hamel and Schauder bases, isomorphisms, strictly singular operators, more on the James space.	
<b>10. Weakly Compact Sets and Spaces They Generate</b> .....	<b>217</b>
Weakly compactly generated spaces, the notion of an Eberlein compact, the notion of a Markushevich's basis, Amir-Lindenstrauss' projectional resolutions of the identity on weakly compactly generated spaces, Davis-Figiel-Johnson-Pelczyński's factorization, Rosenthal's characterization of Eberlein compacta, weakly Lindelöf spaces (Preiss-Talagrand), scattered compacta, the notion of a uniform Eberlein compact and renorming of $C(K)$ by uniformly Gâteaux differentiable norms (Argyros-Benyamini-Farmaki-Starbird-Troyanski), quasicomplements (Gurarii-Kadets), Polish or Čech complete balls in their weak topology (Godefroy, Edgar, Wheeler), absolutely summing operators, Pietsch's lemma and the Dvoretzky-Rogers theorem, the Dunford-Pettis property. In Exercises: Examples, the three space property, weakly countably determined (Vašák) spaces, the Namioka property, other types of compacta.	
<b>11. Uniform Rotundity, Finite Representability</b> .....	<b>263</b>
Uniform rotundity, the modulus of rotundity, uniform Fréchet differentiability, duality, uniform convexity of $L_p$ spaces for $p \in (1, \infty)$ , Kadets's result on unconditional bases in uniformly rotund spaces, the notion of finite representability, the local reflexivity principle, superreflexive spaces, Enflo's renorming of superreflexive spaces, the Gurarii-Gurarii-James theorem on Schauder bases in superreflexive spaces. In Exercises: Examples on uniform convexity and smoothness, URED norms, the type and cotype of Banach spaces, Stegall's results on trees in dual spaces, the original definition of Tsirelson's space.	
<b>12. Application of Smoothness in Banach Spaces</b> .....	<b>289</b>
Kadets's result that all infinite-dimensional separable reflexive Banach spaces are mutually homeomorphic, Aharoni's result that every separable Banach space is Lipschitz equivalent to a subset of $c_0$ , the Heinrich-Mankiewicz method of linearization of Lipschitz maps, the smooth variational principle and the Bishop-Phelps theorem as its consequence, Lindenstrauss' result on the density of norm attaining operators, the Bonic-Frampton result on smooth approximation in separable spaces, subdifferentiability. In Exercises: Examples on the smooth variational principle, rotundity, the Aharoni-Lindenstrauss space, the Gorelik principle, the Haar measure.
