|----------|----------------------------------------------------|-----------|
| <b>1</b> | <b>Introduction to Traffic Flow Modelling</b>      | <b>1</b>  |
| 1.1      | Traffic Flow Modelling Cycle                       | 2         |
| 1.2      | Observations and Phenomena                         | 4         |
| 1.2.1    | Observing Traffic                                  | 4         |
| 1.2.2    | Phenomena in Traffic                               | 6         |
| 1.3      | Traffic Flow Models                                | 8         |
| 1.3.1    | Agent-Based Models and Their Variables             | 8         |
| 1.3.2    | Continuum Models and Edie's Definitions            | 9         |
| 1.3.3    | Classifications of Models                          | 11        |
| 1.3.4    | Traffic Flow, Fluid Flow and Other Complex Systems | 12        |
| 1.4      | Approach and Scope of This Book                    | 13        |
| 1.4.1    | The Genealogical Model Tree                        | 13        |
| 1.4.2    | Numerical Methods for Computer Simulation          | 14        |
| 1.4.3    | Other Aspects of Traffic Flow Modelling            | 16        |
|          | Problem Set                                        | 17        |
|          | Further Reading                                    | 18        |
| <b>2</b> | <b>The Fundamental Diagram</b>                     | <b>21</b> |
| 2.1      | High Densities, Low Speeds and Vice Versa          | 21        |
| 2.2      | Shapes of the Fundamental Diagram                  | 23        |
| 2.2.1    | Fundamental Diagrams in Macroscopic Models         | 23        |
| 2.2.2    | Fundamental Diagrams in Microscopic Models         | 25        |
| 2.3      | Properties and Requirements                        | 27        |
| 2.3.1    | Requirements                                       | 27        |
| 2.3.2    | Properties: Capacity, Free Flow and Congestion     | 28        |
| 2.3.3    | Additional Requirements                            | 28        |
| 2.4      | Scatter in the Fundamental Diagram                 | 29        |
|          | Problem Set                                        | 31        |
|          | Further Reading                                    | 34        |

|          |                                                      |           |
|----------|------------------------------------------------------|-----------|
| <b>3</b> | <b>Microscopic Models</b>                            | <b>35</b> |
| 3.1      | Safe-Distance Models                                 | 35        |
| 3.1.1    | Safe-Distance Models with Delay                      | 37        |
| 3.1.2    | High Speeds Versus Safety                            | 38        |
| 3.2      | Stimulus-Response Models                             | 39        |
| 3.2.1    | More Recent Stimulus-Response Models: OVM and IDM    | 40        |
| 3.2.2    | Simulation Results with a Stimulus Response Model    | 41        |
| 3.2.3    | Generic Model and Stability                          | 41        |
| 3.3      | Action Point Models                                  | 45        |
| 3.4      | Cellular-Automata Models                             | 45        |
| 3.5      | Extensions                                           | 46        |
| 3.5.1    | Heterogeneity                                        | 46        |
| 3.5.2    | Multi-Anticipation                                   | 46        |
| 3.5.3    | Time Delay                                           | 47        |
| 3.5.4    | Lateral Movements                                    | 47        |
| 3.6      | Numerical Methods for Car-Following Models           | 48        |
| 3.6.1    | Advanced Numerical Methods                           | 48        |
| 3.6.2    | Numerical Methods and Delay                          | 49        |
|          | Problem Set                                          | 49        |
|          | Further Reading                                      | 51        |
| <b>4</b> | <b>Macroscopic Models</b>                            | <b>53</b> |
| 4.1      | Kinematic Wave Models                                | 53        |
| 4.1.1    | Graphical Derivation                                 | 54        |
| 4.1.2    | Method of Characteristics                            | 55        |
| 4.1.3    | Simulation Results with the Kinematic Wave Model     | 60        |
| 4.1.4    | Critique and Adaptations of the Kinematic Wave Model | 63        |
| 4.2      | Multi-Class Kinematic Wave Models                    | 63        |
| 4.2.1    | Multi-Dimensional Fundamental Diagram                | 65        |
| 4.2.2    | Fastlane                                             | 65        |
| 4.2.3    | Models with Three Regimes                            | 67        |
| 4.2.4    | Porous Flow Models                                   | 68        |
| 4.2.5    | Requirements of Multi-Class Models                   | 68        |
| 4.3      | Higher-Order Models                                  | 69        |
| 4.3.1    | Critique on Higher Order Models                      | 69        |
| 4.3.2    | Anisotropic Higher Order Models                      | 70        |
| 4.3.3    | Generic Higher Order Model                           | 71        |
| 4.4      | Moving Coordinates                                   | 72        |
| 4.4.1    | The Lagrangian Coordinate System                     | 72        |
| 4.4.2    | Graphical Derivation                                 | 74        |
| 4.4.3    | Generic Higher Order Model in Lagrangian Coordinates | 75        |
| 4.5      | Bounded Acceleration, Hysteresis and Capacity Drop   | 75        |
| 4.5.1    | Bounded Acceleration                                 | 75        |
| 4.5.2    | Hysteresis                                           | 77        |
|          | Problem Set                                          | 77        |
|          | Further Reading                                      | 81        |

|                                                                          |     |
|--------------------------------------------------------------------------|-----|
| <b>5 Numerical Methods for Continuum Models</b> .....                    | 83  |
| 5.1 Finite Difference Methods and Time Stepping .....                    | 83  |
| 5.1.1 Explicit Time Stepping .....                                       | 84  |
| 5.1.2 First Order Finite Difference Methods .....                        | 84  |
| 5.1.3 Stability of Numerical Methods .....                               | 86  |
| 5.2 Minimum Supply Demand Method for Kinematic Wave Models ....          | 86  |
