

Table of contents

Committees	11
Organizers and sponsors	13
Scientific programme	21
Plenary lectures	34
<i>Oliver Ernst:</i>	
Uncertainty quantification for PDE models	35
<i>Pavel Krejčí:</i>	
Hysteresis modeling in piezoelectric and magnetostrictive materials . . .	36
<i>Vít Průša:</i>	
Thermodynamics of viscoelastic rate-type fluids and its implications for stability analysis	37
<i>Daya Reddy:</i>	
Convergent approximations for near-incompressible and near-inextensible transversely isotropic elasticity	38
<i>Sergey Repin:</i>	
Reliable quantitative analysis of incompressible media problems	39
<i>Ulrich Rüde:</i>	
Parallel algorithms for solving finite element systems with a ten trillion unknowns	40
<i>Yousef Saad:</i>	
Numerical linear algebra for data-driven applications	41
<i>Joachim Schöberl:</i>	
NGSolve - A framework for advanced finite element methods	43
Minisymposium 1	
<i>Recent Advances in Robust and Efficient Preconditioning Methods</i>	44
<i>Owe Axelsson:</i>	
New applications of the PRESB preconditioning method	45
<i>János Karátson:</i>	
Robust preconditioning methods using equivalent operators	46
<i>Tomáš Lubér:</i>	
Single and double Schur complement preconditioners for the Biot systems	47
<i>Stefan Meggendorfer:</i>	
Monolithic preconditioning of Biot's consolidation model	48

<i>Maya Neytcheva:</i>	
Deflation techniques – advances, based on utilizing the Generalized Locally Toeplitz theory	49
<i>Jan Papež:</i>	
From a posteriori algebraic error estimator to multilevel iterative solver with p -robust behavior	50
<i>Yousef Saad:</i>	
Parallel Multilevel Low-Rank approximation preconditioners	51
<i>Miroslav Tůma:</i>	
Stretching for solving the linear least squares	52
Minisymposium 2	
<i>Reliable Numerical Methods in Structural Mechanics and Flow Problems</i>	53
<i>Darya Apushkinskaya:</i>	
Some estimates for solutions of the thin obstacle problem	54
<i>Leonardo Baffico:</i>	
Fluid-structure interaction problems with friction boundary condition on the interface	55
<i>Jana Burkotová:</i>	
Optimal thickness distribution of stepped nonlinear Gao beam	56
<i>Vít Dolejší:</i>	
Space-time discontinuous Galerkin method for the numerical solution of degenerate parabolic equations	57
<i>Pavel Exner:</i>	
Extended finite element method for approximation of groundwater flow singularities	58
<i>Jaroslav Haslinger:</i>	
The parameter identification in the Stokes system with threshold slip boundary conditions	59
<i>Amina Chorfi:</i>	
A domain decomposition method for a bonded structure	60
<i>Radek Kučera:</i>	
Stokes problem with the stick-slip boundary condition in 3D	61
<i>Jitka Machalová:</i>	
The control variational method for nonlinear Gao beam	62
<i>Svetoslav Nakov:</i>	
Reliable solution of the Poisson-Boltzmann equation with application to the SecYEG membrane channel	63
<i>Horymír Netuka:</i>	
Buckling solution for nonlinear Gao beam	64

<i>Daya Reddy:</i>	
Some perspectives on rate-independent strain-gradient plasticity	65
<i>Stanislav Sysala:</i>	
Duality theory methods for limit load analysis in perfect plasticity	66
<i>Tomáš Vejchodský:</i>	
Rigorous and fully computable a posteriori error bounds for eigenfunctions	67
Minisymposium 3	
<i>Numerical Methods for Massively Parallel Computations</i>	68
<i>Peter Arbenz:</i>	
Solving large-scale interior eigenvalue problems to investigate the vibrational properties of the boson peak regime in amorphous materials	69
<i>Achim Basermann:</i>	
Exascale sparse eigensolver developments for quantum physics applications	70
<i>Tomáš Brzobohatý:</i>	
ESPRESO - Highly parallel finite element package for engineering simulations	71
<i>Thibault Cimić:</i>	
Enlarged Krylov methods and 2-level preconditionner for the map-making problem in CMB data analysis	73
<i>Martin Hanek:</i>	
Multilevel BDDC method for incompressible Navier-Stokes equations . . .	74
<i>David Horák:</i>	
Projector-avoiding highly scalable variant of TFETI for contact problems implemented in the PERMON toolbox	75
<i>Bruno Lang:</i>	
Efficient parallel reduction of bandwidth in direct eigensolvers	76
<i>Jakub Šístek:</i>	
Parallel multilevel domain decomposition with adaptive mesh refinement	77
<i>Mawussi Zounon:</i>	
Parallel linear algebra software reengineering for modern multicore architectures	78

Minisymposium 4

Uncertainty Quantification in Boundary, Initial, Engineering, and Other Problems

79

Jan Březina:

- Multilevel Monte Carlo method for Darcy flow in fractured
porous media 80

Jan Franců:

- Homogenization of problems with uncertain hysteresis operators 81

Truong-Vinh Hoang:

- Non-deterministic parameter identification using Dempster's rule
of combination on random set models 82

Jan Chleboun:

- A data-driven membership function in uncertainty quantification
of a magnetostrictive energy harvester output 83

Marie Kubínová:

- New spectral bounds to preconditioned stochastic Galerkin systems 84

Anna Kučerová:

- Bayesian inference in thermal tomography 85

Jana Radová:

- Optimal control method for solution of nonlinear inverse problem 86

Eva Vidličková:

- A posteriori error estimation for random time dependent PDEs 87

Jaroslav Vondřejc:

- Bayesian parameter identification for highly nonlinear problems 88

Minisymposium 5

Modelling of Coupled Processes in Porous Media and Other Multiphysics Problems

89

Andrés Arrarás:

- Multipoint flux approximation methods for a double-porosity
Darcy–Forchheimer flow model in porous media 90

Markus Bause:

- The Nitsche method for higher order Galerkin–collocation approximation
in time of the Navier–Stokes equations 91

Michal Bérés:

- Numerical methods for simulation of steady flow in fractured porous
media with hydro-mechanical coupling 92

Martin Dugstad:

- Upscaling of polymer EOR in fractured media 93

Herbert Egger:

- Structure preserving approximation of quasistatic poroelasticity 94

Adina Chirilă:

Wave propagation in diffusive microstretch thermoelasticity 95

Jakub Kmec:

A semi-continuum model to explain fluid flow in unsaturated
homogeneous porous medium 96

Pavel Krejčí:

A model for phase transitions in deformable porous media 97

Chak Lee:

Nonlinear multigrid solvers for subsurface flow simulation
using spectral coarsening 98

Vladimír Lukeš:

Computational homogenization of large deforming fluid-saturated
porous structures 99

Maria Lymbery:

Parameter-robust fixed-stress split iterative scheme for
multiple-permeability poroelasticity 100

Rostislav Vodák:

Richard's equation and a semi-continuum model for fluid flow
in porous medium 101

Minisymposium 6

Challenging Computations in Complicated Materials 102

Jan Blechta:

On PCD preconditioner for Navier-Stokes equations 103

Pablo Alexei Gazca-Orozco:

Preconditioning systems arising from a 3-Field discretisation
of incompressible non-Newtonian flow 104

Michal Habera:

Concrete ageing: computational and high-performance aspects 105

Martin Řehoř:

Incorporation of slip in numerical simulation of extrusion flow
of SBR compounds 106

Karel Tůma:

Cubic to tetragonal martensitic transformation in NiAl shape
memory alloy 107

Zdeněk Čada:

- Weight reducing of track rod arm structure by using of several optimization approaches 109

Martin Čermák:

- The methodology for material model identification and validation.
Part 1 – Theory 110

Radim Halama:

- The methodology for material model identification and validation.
Part 2 - Application to monotonic biaxial loading 111

Stanislav Harizanov:

- Digital image processing of porous media via constrained convex optimization 112

Martin Hasal:

- Modelling of THM processes for the design of the safe deep nuclear waste repository 113

Milan Hokr:

- Flow and transport inverse modelling with parameterization of the fracture laser scan input data 114

Eva Hruběšová, Nadě Rařantová:

- How to simulate hydro-mechanical behaviour of complex unstable slope? . 115

Olaf Kolditz:

- Modeling of geosystems for energy applications 117

Ondřej Zabal, Tomáš Koudelka:

- Numerical analysis of coupled heat and moisture transfer in facades . . . 119

Tomáš Kozubek:

- About IT4Innovations and cooperation with industry 120

Tomáš Krátký:

- Numerical modelling applications in pump industry 121

Michal Kroupa, Vojtěch Zmuda:

- Practical aspects of coupled groundwater flow and contaminant transport modelling in the context of remediation after in situ leaching of uranium 122

Jaroslav Kruis:

- Numerical analysis of geotechnical stability based on coupled hydro-mechanical model of soil 124

Igor Mikulčík, Jaroslav Kruis:

- Numerical analysis of thermoplastic tanks 125

Guillaume Pierrot:

- On some mathematical challenges in industrial CFD 126

<i>Taro Sono:</i>	
DEM analysis of chipping of concrete by a pneumatic breaker and mechanism of its damage	128
Contributed talks	129
<i>Michaela Bailová:</i>	
A mountain pass algorithm for quasilinear boundary value problem with p-Laplacian	130
<i>Bohumír Bastl:</i>	
Multi-patch B-spline parameterizations of blade cascades and their influence to incompressible fluid flow simulations by isogeometric analysis	131
<i>Arkadi Berezovski:</i>	
Internal variables as a tool for microstructure influence modeling	132
<i>Robert Cimrman:</i>	
Optimized pseudopotentials for electronic structure calculations	133
<i>Rafael Company:</i>	
Numerical solution of American option pricing problems under stochastic volatility	134
<i>Zdeněk Dostál:</i>	
Conditioning of large H-TFETI clusters and the scope of scalability	135
<i>Miloslav Feistauer:</i>	
Discontinuous Galerkin method for the simulation of fluid-structure interaction with applications to vocal fold vibrations	136
<i>Dušan Gabriel:</i>	
Explicit bipenalty finite element contact-impact algorithm	137
<i>Lucas Jódar:</i>	
Solving numerically random hyperbolic problems	138
<i>Radek Kolman:</i>	
Inverse mass matrix for higher-order finite element method via localized Lagrange multipliers	139
<i>Dalibor Lukáš:</i>	
A uniform parallel framework to large-scale simulations of 3d wave-type equations	141
<i>Svetozar Margenov:</i>	
BURA method for fractional diffusion problems with Neumann boundary conditions	142
<i>Michal Mračko:</i>	
Computational Time reversal: localization of cracks	143

Jan Pech:

Spectral/hp element method in simulations of unsteady flows with heat transfer	144
---	-----

Brajesh K. Singh:

Free-surface LBM simulation of droplet dynamics with the waLBerla multiphysics framework	145
---	-----

Jurjen Duintjer Tebbens:

Extending a pharmacodynamic model for nuclear receptor-induced enzyme production with spatial resolution	147
---	-----

Jiří Vala:

Exact solutions of a thick beam on Pasternak subsoil in finite element calculations	148
--	-----

Posters

149

Juliana Arbelaez Gaviria:

Numerical solution of water flow in porous medium under phase changes due evaporation	150
--	-----

Michaela Bobková:

The bending of a beam with obstacle and given friction	151
--	-----

Simona Domesová:

Acceleration of posterior sampling using surrogate models	152
---	-----

Ladislav Foltyn:

Parallel method for solving transient heat equation	153
---	-----

Jiří Jablonský:

Systems biology analysis of an <i>in vitro</i> xenobiotic metabolizing enzyme induction	154
--	-----

Michal Kuráž:

Solving the erosion transport equation on three dimensional catchments .	155
--	-----

Martin Ladecký:

FFT-based homogenisation accelerated by low-rank approximations . . .	156
---	-----

Michal Merta:

A parallel space-time boundary element method for the heat equation . .	157
---	-----

Erika Straková:

Piezo-acoustic FEM analysis	158
---------------------------------------	-----

David Ulčák:

High-order BEM and Gauss-Christoffel quadrature	160
---	-----
