

Contents

Preface	v
Contents	vii
1 Automated manufacturing	1
1.1 Introduction	3
1.2 Production planning for FMSs	4
1.2.1 What is an FMS?	4
1.2.2 The hierarchical approach	5
1.2.3 Tactical Planning	7
1.2.4 Operational planning	10
1.3 Overview of the monograph	11
2 Throughput rate optimization in the automated assembly of printed circuit boards	17
2.1 Introduction	19
2.2 Technological environment	20
2.3 The throughput rate optimization problem	23
2.4 Workload balancing	25
2.4.1 Subproblem (A)	25
2.4.2 Subproblem (B)	29
2.5 Scheduling of individual machines	31
2.5.1 Subproblem (C)	32
2.5.2 Subproblem (D)	34
2.5.3 Subproblem (E)	37
2.5.4 Subproblem (F)	39
2.6 An example	42

3	Approximation algorithms for three-dimensional assignment problems with triangle inequalities	47
3.1	Introduction	49
3.2	Complexity of $T\Delta$ and $S\Delta$	50
3.3	Approximation algorithms	52
3.4	Computational results	59
4	Scheduling jobs of equal length: complexity and facets	63
4.1	Introduction	65
4.2	Complexity of SEL	66
4.3	A partial polyhedral description of SEL	70
4.4	A cutting-plane algorithm for SEL	79
5	A column generation approach to job grouping	83
5.1	Introduction	85
5.2	Lower bounds	86
5.2.1	The job grouping problem	87
5.2.2	Column generation	89
5.2.3	The generation subproblem	90
5.2.4	Computation of lower bounds via column generation	92
5.2.5	Lagrangian relaxation	94
5.2.6	Other lower bounds	96
5.3	Upper bounds	98
5.3.1	Sequential heuristics for grouping	98
5.3.2	Set covering heuristics	99
5.4	Implementation	100
5.5	Computational experiments	103
5.5.1	Generation of problem instances	103
5.5.2	Computational results	105
5.6	Summary and conclusions	113
6	The job grouping problem for flexible manufacturing systems: some extensions	115
6.1	Introduction	117
6.2	Multiple slots	117
6.2.1	The job grouping problem	117
6.2.2	Lower bounds via column generation	119
6.2.3	Other lower bounds	120
6.2.4	Upper bounds	121

6.2.5	Adjusting the column generation procedure	122
6.2.6	Computational experiments	124
6.2.7	Computational results	125
6.3	Multiple machines	133
6.3.1	The job grouping problem	133
6.3.2	Lower bounds via column generation	133
6.3.3	Other lower bounds	134
6.3.4	Upper bounds	135
6.3.5	Adjusting the column generation procedure	135
6.3.6	Computational experiments	136
6.3.7	Computational results	137
6.4	Other extensions	142
6.5	Summary and conclusions	143
7	A local search approach to job grouping	145
7.1	Introduction	147
7.2	Local search environment	148
7.2.1	Starting solution	149
7.2.2	Objective function	150
7.2.3	Neighbourhood structure	151
7.2.4	Stopping criteria	151
7.3	Local search approaches	152
7.3.1	Simple improvement approach	152
7.3.2	Tabu search approach	152
7.3.3	Simulated annealing approach	153
7.3.4	Variable-depth approach	154
7.4	Computational experiments	155
7.4.1	The dataset	155
7.4.2	Computational results	157
7.5	Summary and conclusions	162
8	Minimizing the number of tool switches on a flexible machine	165
8.1	Introduction	167
8.2	Basic results	170
8.2.1	\mathcal{NP} -hardness results	170
8.2.2	Finding the minimum number of setups for a fixed job sequence	172
8.3	Heuristics	176

8.3.1	Traveling salesman heuristics	176
8.3.2	Block minimization heuristics	177
8.3.3	Greedy heuristics	179
8.3.4	Interval heuristic	180
8.3.5	2-Opt strategies	181
8.3.6	Load-and-Optimize strategy	182
8.4	Computational experiments	183
8.4.1	Generation of problem instances	183
8.4.2	Computational results	184
8.5	Lower bounds	190
8.5.1	Traveling salesman paths	190
8.5.2	Structures implying extra setups	191
8.5.3	Valid inequalities	193
8.5.4	Lagrangian relaxation	194
	Appendix: Graph-theoretic definitions	196
