

This book is an introduction to the techniques of many-body quantum theory with a large number of applications to condensed matter physics. The basic idea of the book is to provide a self-contained formulation of the theoretical framework without losing mathematical rigor, while at the same time providing physical motivation and examples. The examples are taken from applications in electron systems and transport theory.

On the formal side, the book covers an introduction to second quantization, many-body Green's function, finite temperature Feynman diagrams and bosonization. The applications include traditional transport theory in bulk as well as mesoscopic systems, where both the Landauer-Büttiker formalism and recent developments in correlated transport phenomena in mesoscopic systems and nano-structures are covered. Other topics include interacting electron gases, plasmons, electron-phonon interactions, superconductivity and one-dimensional systems, and Luttinger liquid theory.

Having grown out of a set of lecture notes, incorporating many pedagogical exercises, this book is designed as a textbook for an advanced undergraduate or graduate course, but is also well suited for self-study.

<b>1</b>	<b>First and second quantization</b>	<b>1</b>
1.1	First quantization, single-particle systems	2
1.2	First quantization, many-particle systems	4
1.2.1	Permutation symmetry and indistinguishability	5
1.2.2	The single-particle states as basis states	6
1.2.3	Operators in first quantization	8
1.3	Second quantization, basic concepts	10
1.3.1	The occupation number representation	10
1.3.2	The boson creation and annihilation operators	10
1.3.3	The fermion creation and annihilation operators	13
1.3.4	The general form for second quantization operators	14
1.3.5	Change of basis in second quantization	16
1.3.6	Quantum field operators and their Fourier transforms	17
1.4	Second quantization, specific operators	18
1.4.1	The harmonic oscillator in second quantization	18
1.4.2	The electromagnetic field in second quantization	19
1.4.3	Operators for kinetic energy, spin, density and current	21
1.4.4	The Coulomb interaction in second quantization	23
1.4.5	Basis states for systems with different particles	25
1.5	Second quantization and statistical mechanics	26
1.5.1	The distribution function for non-interacting fermions	29
1.5.2	The distribution function for non-interacting bosons	29
1.6	Summary and outlook	30
<b>2</b>	<b>The electron gas</b>	<b>32</b>
2.1	The non-interacting electron gas	33
2.1.1	Bloch theory of electrons in a static ion lattice	33
2.1.2	Non-interacting electrons in the jellium model	36
2.1.3	Non-interacting electrons at finite temperature	39
2.2	Electron interactions in perturbation theory	40
2.2.1	Electron interactions in 1 <sup>st</sup> -order perturbation theory	42
2.2.2	Electron interactions in 2 <sup>nd</sup> -order perturbation theory	44
2.3	Electron gases in 3, 2, 1 and 0 dimensions	45
2.3.1	3D electron gases: metals and semiconductors	45
2.3.2	2D electron gases: GaAs/GaAlAs heterostructures	47
2.3.3	1D electron gases: carbon nanotubes	49
2.3.4	0D electron gases: quantum dots	50
2.4	Summary and outlook	51

<b>3</b>	<b>Phonons; coupling to electrons</b>	52
3.1	Jellium oscillations and Einstein phonons	52
3.2	Electron-phonon interaction and the sound velocity	53
3.3	Lattice vibrations and phonons in 1D	54
3.4	Acoustical and optical phonons in 3D	57
3.5	The specific heat of solids in the Debye model	59
3.6	Electron-phonon interaction in the lattice model	61
3.7	Electron-phonon interaction in the jellium model	64
3.8	Summary and outlook	65
<b>4</b>	<b>Mean-field theory</b>	66
4.1	Basic concepts of mean-field theory	66
4.2	The art of mean-field theory	69
4.3	Hartree-Fock approximation	70
4.3.1	H-F approximation for the homogenous electron gas	71
4.4	Broken symmetry	72
4.5	Ferromagnetism	74
4.5.1	The Heisenberg model of ionic ferromagnets	74
4.5.2	The Stoner model of metallic ferromagnets	76
4.6	Summary and outlook	78
<b>5</b>	<b>Time dependence in quantum theory</b>	80
5.1	The Schrödinger picture	80
5.2	The Heisenberg picture	81
5.3	The interaction picture	81
5.4	Time-evolution in linear response	84
5.5	Time-dependent creation and annihilation operators	84
5.6	Fermi's golden rule	86
5.7	The $T$ -matrix and the generalized Fermi's golden rule	87
5.8	Fourier transforms of advanced and retarded functions	88
5.9	Summary and outlook	90
<b>6</b>	<b>Linear response theory</b>	92
6.1	The general Kubo formula	92
6.1.1	Kubo formula in the frequency domain	94
6.2	Kubo formula for conductivity	95
6.3	Kubo formula for conductance	97
6.4	Kubo formula for the dielectric function	98
6.4.1	Dielectric function for translation-invariant system	100
6.4.2	Relation between dielectric function and conductivity	100
6.5	Summary and outlook	101

<b>7</b>	<b>Transport in mesoscopic systems</b>	102
7.1	The $S$ -matrix and scattering states	103
7.1.1	Definition of the $S$ -matrix	103
7.1.2	Definition of the scattering states	106
7.1.3	Unitarity of the $S$ -matrix	106
7.1.4	Time-reversal symmetry	107
7.2	Conductance and transmission coefficients	108
7.2.1	The Landauer formula, heuristic derivation	109
7.2.2	The Landauer formula, linear response derivation	111
7.2.3	Landauer–Büttiker formalism for multiprobe systems	112
7.3	Electron wave guides	113
7.3.1	Quantum point contact and conductance quantization	113
7.3.2	The Aharonov–Bohm effect	117
7.4	Summary and outlook	118
<b>8</b>	<b>Green’s functions</b>	120
8.1	“Classical” Green’s functions	120
8.2	Green’s function for the one-particle Schrödinger equation	120
8.2.1	Example: from the $S$ -matrix to the Green’s function	123
8.3	Single-particle Green’s functions of many-body systems	124
8.3.1	Green’s function of translation-invariant systems	125
8.3.2	Green’s function of free electrons	125
8.3.3	The Lehmann representation	127
8.3.4	The spectral function	129
8.3.5	Broadening of the spectral function	130
8.4	Measuring the single-particle spectral function	131
8.4.1	Tunneling spectroscopy	132
8.5	Two-particle correlation functions of many-body systems	135
8.6	Summary and outlook	138
<b>9</b>	<b>Equation of motion theory</b>	139
9.1	The single-particle Green’s function	139
9.1.1	Non-interacting particles	141
9.2	Single level coupled to a continuum	141
9.3	Anderson’s model for magnetic impurities	142
9.3.1	The equation of motion for the Anderson model	144
9.3.2	Mean-field approximation for the Anderson model	145
9.4	The two-particle correlation function	148
9.4.1	The random phase approximation	148
9.5	Summary and outlook	150
<b>10</b>	<b>Transport in interacting mesoscopic systems</b>	151
10.1	Model Hamiltonians	151
10.2	Sequential tunneling: the Coulomb blockade regime	153
10.2.1	Coulomb blockade for a metallic dot	154
10.2.2	Coulomb blockade for a quantum dot	157

10.3	Coherent many-body transport phenomena	158
10.3.1	Cotunneling	158
10.3.2	Inelastic cotunneling for a metallic dot	159
10.3.3	Elastic cotunneling for a quantum dot	160
10.4	The conductance for Anderson-type models	161
10.4.1	The conductance in linear response	162
10.4.2	Calculation of Coulomb blockade peaks	165
10.5	The Kondo effect in quantum dots	168
10.5.1	From the Anderson model to the Kondo model	168
10.5.2	Comparing Kondo effect in metals and quantum dots	173
10.5.3	Kondo-model conductance to second order in $H_S^{(2)}$	173
10.5.4	Kondo-model conductance to third order in $H_S^{(2)}$	174
10.5.5	Origin of the logarithmic divergence	179
10.5.6	The Kondo problem beyond perturbation theory	181
10.6	Summary and outlook	182
11	<b>Imaginary-time Green's functions</b>	184
11.1	Definitions of Matsubara Green's functions	187
11.1.1	Fourier transform of Matsubara Green's functions	188
11.2	Connection between Matsubara and retarded functions	189
11.2.1	Advanced functions	191
11.3	Single-particle Matsubara Green's function	192
11.3.1	Matsubara Green's function, non-interacting particles	192
11.4	Evaluation of Matsubara sums	193
11.4.1	Summations over functions with simple poles	194
11.4.2	Summations over functions with known branch cuts	196
11.5	Equation of motion	197
11.6	Wick's theorem	198
11.7	Example: polarizability of free electrons	201
11.8	Summary and outlook	202
12	<b>Feynman diagrams and external potentials</b>	204
12.1	Non-interacting particles in external potentials	204
12.2	Elastic scattering and Matsubara frequencies	206
12.3	Random impurities in disordered metals	208
12.3.1	Feynman diagrams for the impurity scattering	209
12.4	Impurity self-average	211
12.5	Self-energy for impurity scattered electrons	216
12.5.1	Lowest-order approximation	217
12.5.2	First-order Born approximation	217
12.5.3	The full Born approximation	220
12.5.4	Self-consistent full Born approximation and beyond	222
12.6	Summary and outlook	224

<b>13 Feynman diagrams and pair interactions</b>	226
13.1 The perturbation series for $\mathcal{G}$	227
13.2 The Feynman rules for pair interactions	228
13.2.1 Feynman rules for the denominator of $\mathcal{G}(b, a)$	229
13.2.2 Feynman rules for the numerator of $\mathcal{G}(b, a)$	230
13.2.3 The cancellation of disconnected Feynman diagrams	231
13.3 Self-energy and Dyson's equation	233
13.4 The Feynman rules in Fourier space	233
13.5 Examples of how to evaluate Feynman diagrams	236
13.5.1 The Hartree self-energy diagram	236
13.5.2 The Fock self-energy diagram	237
13.5.3 The pair-bubble self-energy diagram	238
13.6 Cancellation of disconnected diagrams, general case	239
13.7 Feynman diagrams for the Kondo model	241
13.7.1 Kondo model self-energy, second order in $J$	243
13.7.2 Kondo model self-energy, third order in $J$	244
13.8 Summary and outlook	245
<b>14 The interacting electron gas</b>	246
14.1 The self-energy in the random phase approximation	246
14.1.1 The density dependence of self-energy diagrams	247
14.1.2 The divergence number of self-energy diagrams	248
14.1.3 RPA resummation of the self-energy	248
14.2 The renormalized Coulomb interaction in RPA	250
14.2.1 Calculation of the pair-bubble	251
14.2.2 The electron-hole pair interpretation of RPA	253
14.3 The groundstate energy of the electron gas	253
14.4 The dielectric function and screening	256
14.5 Plasma oscillations and Landau damping	260
14.5.1 Plasma oscillations and plasmons	262
14.5.2 Landau damping	263
14.6 Summary and outlook	264
<b>15 Fermi liquid theory</b>	266
15.1 Adiabatic continuity	266
15.1.1 Example: one-dimensional well	267
15.1.2 The quasiparticle concept and conserved quantities	268
15.2 Semi-classical treatment of screening and plasmons	269
15.2.1 Static screening	270
15.2.2 Dynamical screening	271
15.3 Semi-classical transport equation	272
15.3.1 Finite lifetime of the quasiparticles	276
15.4 Microscopic basis of the Fermi liquid theory	278
15.4.1 Renormalization of the single-particle Green's function	278
15.4.2 Imaginary part of the single-particle Green's function	280
15.4.3 Mass renormalization?	283
15.5 Summary and outlook	283

<b>16 Impurity scattering and conductivity</b>	285
16.1 Vertex corrections and dressed Green's functions	286
16.2 The conductivity in terms of a general vertex function	291
16.3 The conductivity in the first Born approximation	293
16.4 Conductivity from Born scattering with interactions	296
16.5 The weak localization correction to the conductivity	298
16.6 Disordered mesoscopic systems	308
16.6.1 Statistics of quantum conductance, random matrix theory	308
16.6.2 Weak localization in mesoscopic systems	309
16.6.3 Universal conductance fluctuations	310
16.7 Summary and outlook	312
<b>17 Green's functions and phonons</b>	313
17.1 The Green's function for free phonons	313
17.2 Electron-phonon interaction and Feynman diagrams	314
17.3 Combining Coulomb and electron-phonon interactions	316
17.3.1 Migdal's theorem	317
17.3.2 Jellium phonons and the effective electron-electron interaction	318
17.4 Phonon renormalization by electron screening in RPA	319
17.5 The Cooper instability and Feynman diagrams	322
17.6 Summary and outlook	324
<b>18 Superconductivity</b>	325
18.1 The Cooper instability	325
18.2 The BCS groundstate	327
18.3 Microscopic BCS theory	329
18.4 BCS theory with Matsubara Green's functions	331
18.4.1 Self-consistent determination of the BCS order parameter $\Delta_k$	332
18.4.2 Determination of the critical temperature $T_c$	333
18.4.3 Determination of BCS quasiparticle density of states	334
18.5 The Nambu formalism of the BCS theory	335
18.5.1 Spinors and Green's functions in Nambu formalism	335
18.5.2 The Meissner effect and the London equation	336
18.5.3 Zero paramagnetic current response in BCS theory	337
18.6 Gauge symmetry breaking and zero resistivity	341
18.6.1 Gauge transformations	341
18.6.2 Broken gauge symmetry and dissipationless current	342
18.7 The Josephson effect	343
18.8 Summary and outlook	346

<b>19 1D electron gases and Luttinger liquids</b>	<b>347</b>
19.1 What is a Luttinger liquid?	347
19.2 Experimental realizations of Luttinger liquid physics	348
19.2.1 Example: Carbon Nanotubes	348
19.2.2 Example: semiconductor wires	348
19.2.3 Example: quasi 1D materials	348
19.2.4 Example: Edge states in fractional quantum Hall effect	348
19.3 A first look at the theory of interacting electrons in 1D	348
19.3.1 The “quasiparticles” in 1D	350
19.3.2 The lifetime of the “quasiparticles” in 1D	351
19.4 The spinless Luttinger–Tomonaga model	352
19.4.1 The Luttinger–Tomonaga model Hamiltonian	352
19.4.2 Inter-branch interaction	354
19.4.3 Intra-branch interaction and charge conservation	355
19.4.4 Umklapp processes in the half-filled band case	356
19.5 Bosonization of the Tomonaga model Hamiltonian	357
19.5.1 Derivation of the bosonized Hamiltonian	357
19.5.2 Diagonalization of the bosonized Hamiltonian	360
19.5.3 Real space representation	360
19.6 Electron operators in bosonized form	363
19.7 Green’s functions	368
19.8 Measuring local density of states by tunneling	369
19.9 Luttinger liquid with spin	373
19.10 Summary and outlook	374
<b>A Fourier transformations</b>	<b>376</b>
A.1 Continuous functions in a finite region	376
A.2 Continuous functions in an infinite region	377
A.3 Time and frequency Fourier transforms	377
A.4 Some useful rules	377
A.5 Translation-invariant systems	378
