

Crystallography is an interdisciplinary science covering a wide area, from biology to earth sciences, mathematics, and materials science. Its role is growing, owing to the contribution crystallography can offer to the understanding of such diverse fields as biological structures, high-temperature superconductors, mineral properties, and phase transitions. This book describes both the theoretical bases and applications of different areas interacting with crystallography. As with the first and second editions, it is organized as a collection of chapters written by recognized specialists, with all contributions being harmonized into a unified whole. The main text is devoted to the presentation of basics; appendices to the chapters deal with specialist aspects. In this third edition topics have been updated so as to document the present state-of-the-art: emphasis is placed upon areas of current research.

- Updated throughout to reflect the current state-of-the-art, and for clearer pedagogy.
- 95 new figures introduced, to aid understanding.
- Reference lists updated to reflect recent advances in the field.
- Many sections completely rewritten, including those on powder crystallography, electron diffraction, phase determination procedures using dual space approaches, and H-bonding.
- New material introduced, including sections on charge-transfer or donor-acceptor interactions, electron density modification methods, and humidity control of macromolecular crystals.

The complimentary CD of the second edition is now available via the web:  
<http://www.ba.ic.cnr.it/abc>. Modern graphics will help users to understand the basics of this science via three-dimensional images, simulation of experiments, and exercises.

#### From reviews of previous editions:

'A new research worker could turn to the appropriate chapter and find a description of how to tackle real problems ... this book is an excellent crystallography text, both for those involved with the subject in a practical sense or those that require fundamental information on the subject ... it has that rare quality that the more it is read, the better it seems. It deserves a place on the shelf of all those involved in, or interested in, crystallography.'

*Materials World*

'This is a remarkable text. It is a tribute at once to the wide reach of crystallography over many branches of science and to the contemporary vigor and vitality of Italian crystallography and crystallographers.'

*Acta Crystallographica*

'... there is a good balance achieved between well-illustrated description and mathematical rigour. Established crystallographers will find it a handy reference manual, while at the same time the text remains accessible and informative reading for undergraduates with an interest in crystallography.'

*The Times Higher Education Supplement*

*Cover image:* Cartoon representation of the folding of NAPA from *Helicobacter pylori*, a bacterium that lives in the human stomach. 12 identical monomers, arranged in a nearly spherical shell with 23 symmetry, form an internal cavity where iron can be stored. The space filling model of the protein is shown in the background. Small red spheres represent coordinated Fe ions (Protein Data Bank code 1J14).

# **1 Symmetry in crystals**

**Carmelo Giacovazzo**

- 1.1 The crystalline state and isometric operations
- 1.2 Symmetry elements
  - 1.2.1 Axes of rotational symmetry
  - 1.2.2 Axes of rototranslation or screw axes
  - 1.2.3 Axes of inversion
  - 1.2.4 Axes of rotoreflection
  - 1.2.5 Reflection planes with translational component (glide planes)
- 1.3 Lattices
- 1.4 The rational properties of lattices
  - 1.4.1 Crystallographic directions
  - 1.4.2 Crystallographic planes
- 1.5 Symmetry restrictions due to the lattice periodicity and vice versa
- 1.6 Point groups and symmetry classes
  - 1.6.1 Point groups in one and two dimensions
- 1.7 The Laue classes
- 1.8 The seven crystal systems
- 1.9 The Bravais lattices
  - 1.9.1 Plane lattices
  - 1.9.2 Space lattices
- 1.10 The space groups
- 1.11 The plane and line groups
- 1.12 On the matrix representation of symmetry operators

## **Appendices**

- 1.A The isometric transformations
  - 1.A.1 Direct movements
  - 1.A.2 Opposite movements
- 1.B Some combinations of movements
- 1.C Wigner–Seitz cells
- 1.D The space-group matrices
- 1.E Symmetry groups
  - 1.E.1 Subgroups
  - 1.E.2 Cosets
  - 1.E.3 Conjugate classes

1.E.4	Conjugate subgroups	53
1.E.5	Normal subgroups and factor groups	53
1.E.6	Maximal subgroups and minimal supergroups	55
1.E.7	Maximal subgroups and minimal supergroups for three-dimensional crystallographic point groups	57
1.E.8	Limiting groups in two and three dimensions	57
1.E.9	Representation of a group	58
1.E.10	Character tables	59
1.F	Symmetry generalization	59
1.F.1	The symmetry groups $G_n^m$	60
1.F.2	The $G^1$ groups	60
1.F.3	The $G^2$ groups	60
1.F.4	The $G^3$ groups	60
1.F.5	The $G_n^4$ groups	62
1.F.6	The groups of colour symmetry	62
<b>References</b>		65

## 2 Crystallographic computing 66

### Carmelo Giacovazzo

2.1	Introduction	66
2.2	The metric matrix	66
2.3	The reciprocal lattice	69
2.4	Basis transformations	71
2.5	Transformation from triclinic to orthonormal axes	73
2.6	Rotations in Cartesian systems	75
2.7	Some simple crystallographic calculations	80
2.7.1	Torsion angles	80
2.7.2	Best plane through a set of points	80
2.7.3	Best line through a set of points	82
2.7.4	Principal axes of a quadratic form	82
2.8	Metric considerations on the lattices	84
2.8.1	Niggli reduced cell	84
2.8.2	Sublattices and superlattices	87
2.8.3	Coincidence-site lattices	88
2.9	Calculation of the electron density function	90
2.10	Calculation of the structure factor	92
2.11	The method of least squares	94
2.11.1	Linear least squares	95
2.11.2	Linear least squares with constraints	97
2.11.3	Non-linear (unconstrained) least squares	98
2.11.4	Least-squares refinement of crystal structures	99
2.11.5	Practical considerations on crystallographic least squares	104
2.11.6	Constraints and restraints in crystallographic least squares	110
2.12	Alternatives to the method of least squares	114
2.12.1	Maximum likelihood refinement	115

## Contents

- 2.12.2 Gradient methods
- 2.13 Powder crystallography: techniques for structural analysis
  - 2.13.1 Phasing via powder diffraction
  - 2.13.2 The basis of the Rietveld refinement
  - 2.13.3 Some practical aspects of Rietveld refinement
- 2.14 Analysis of thermal motion
- 2.15 The effect of thermal motion on bond lengths and angles
- 2.16 About the accuracy of the calculated parameters

### Appendices

- 2.A Some metric relations between direct and reciprocal lattices
- 2.B Some geometrical calculations concerning directions and planes
- 2.C Some transformation matrices
- 2.D Reciprocity of F and I lattices
- 2.E Transformations of crystallographic quantities in rectilinear spaces
- 2.F Derivation of the normal equations
- 2.G Derivation of the variance-covariance matrix  $M_x$
- 2.H Derivation of the unbiased estimate of  $M_x$
- 2.I The FFT algorithm and its crystallographic applications

## 3 The diffraction of X-rays by crystals

Carmelo Giacovazzo

- 3.1 Introduction
- 3.2 Basic properties of X-rays
- 3.3 Thomson scattering
- 3.4 Compton scattering
- 3.5 Interference of scattered waves
- 3.6 Scattering by atomic electrons
- 3.7 Scattering by atoms
- 3.8 The temperature factor
- 3.9 Scattering by a molecule or by a unit cell
- 3.10 Diffraction by a crystal
- 3.11 Bragg's law
- 3.12 The reflection and the limiting spheres
- 3.13 Symmetry in reciprocal space
  - 3.13.1 Friedel law
  - 3.13.2 Effects of symmetry operators in the reciprocal space
  - 3.13.3 Determination of the Laue class
  - 3.13.4 Determination of reflections with restricted phase values
  - 3.13.5 Systematic absences
  - 3.13.6 Unequivocal determination of the space group
- 3.14 Diffraction intensities
- 3.15 Anomalous dispersion
- 3.16 The Fourier synthesis and the phase problem

### Appendices

- 3.A Mathematical background
  - 3.A.1 Dirac delta function

3.A.2	A mathematical model for the lattice	194
3.A.3	Convolutions: the mathematical model of a crystal	195
3.A.4	Some properties of convolutions	197
3.A.5	The Fourier transform	198
3.A.6	Some examples of Fourier transform	200
3.A.7	Fourier transform of spherically symmetric functions	204
3.A.8	Deconvolution of spectra	205
3.B	Scattering and related topics	206
3.B.1	Compton scattering	206
3.B.2	The anisotropic temperature factor	206
3.B.3	Symmetry restrictions on the anisotropic temperature factors	209
3.B.4	The Renninger effect and experimental phase determination by means of multiple diffraction experiments	211
3.B.5	Electron diffraction	216
3.B.6	Neutron scattering	220
3.B.7	Electron, neutron and X-ray diffraction: comparison and perspectives	224
3.C	About electron density mapping	228
	<b>References</b>	232

## 4 Beyond ideal crystals 235

### Carmelo Giacovazzo

4.1	Introduction	235
4.2	Ordering types	236
4.3	Crystal twins	237
4.4	Diffuse scattering	244
4.4.1	Thermal diffuse scattering	244
4.4.2	Disorder diffuse scattering	248
4.5	Modulated crystal structures	251
4.6	Quasi-crystals	254
4.6.1	Introductory remarks	254
4.6.2	A mathematical basis	255
4.6.3	Aperiodic tiling and quasi-crystals	258
4.6.4	Embedding quasi-crystals in higher-dimensional space	261
4.7	Liquid crystals (or mesomorphic phases)	264
4.8	The paracrystal	267
4.9	Amorphous and liquid states	270
4.9.1	Diffraction from a finite statistically homogeneous object	271
4.9.2	Diffraction from a finite statistically homogeneous object with equal atoms	272
4.9.3	Diffraction from an isotropic statistically homogeneous object	275
4.9.4	The Debye formula	276
4.10	Diffraction by gases	277
4.11	Diffraction by liquids and amorphous bodies	281

## Contents

### 4.12 Small-angle scattering

## Appendices

### 4.A Examples of twin laws

#### 4.A.1 Cubic system

#### 4.A.2 Tetragonal system

#### 4.A.3 Hexagonal and trigonal systems

#### 4.A.4 Orthorhombic system

#### 4.A.5 Monoclinic system

#### 4.A.6 Triclinic system

### 4.B How to recognize and treat twins

### 4.C Embedding of modulated structures in higher-dimensional space

### 4.D About Fibonacci numbers and sequences
