

FINDS THAT MAKE US RETHINK WHAT IT MEANS TO BE HUMAN

A jawbone embedded in a rock; the bones of a hand sunk into sediment on the floor of a cave a hundred feet underground: These things shape our understanding of human evolution. In this book, paleoanthropologists Lee Berger and John Hawks share the intimate and fascinating story of two such discoveries: fossils found in South Africa that add intricate details—and raise all-important questions—about our ancient human past.
