Acknowledgments

The development of a systematic means of observational gait analysis was a collaborative effort with Rancho Los Amigos physical therapy supervisors and instructors, Downey, California. Membership of this group has changed sufficiently over the 12 years of the program's evolution that I cannot name all the contributors. A thank-you for your help is extended to each person. In addition, I particularly wish to acknowledge the help of Jaqueline Montgomery and Maureen Rodgers, who continue their involvement in the gait project.

For extensive assistance in the final preparation of this book, very special thanks go to JoAnne K. Cronley and Bill Schoneberger. JoAnne, physical therapist and associate director of clinical research in Puthukinesiology, has provided the monumental task of critiquing the entire book, finalizing all the references and creating all the EMG illustrations. Bill, a physical therapist and computer artist, was a major design consultant as well as producer of the computer artwork. Special appreciation also is extended to Dr. Mary Ann Keenan for providing an orthopedist's
